Tensioned Fabric Roof:

Architectural Fabric Structures National Research Council (U.S.). Advisory Board on the Built Environment, 1985 This reprint of the 1985 architectural classic discusses a technology that offers an important alternative to conventional construction having unique properties that make it useful for certain applications Due to improvements in materials structural analysis and environmental control these structures can often be considered permanent buildings The membrane is the principal structural component of a tensioned fabric structure Under certain circumstances a tensioned fabric structure can reduce energy consumption in a building The natural light from the translucent surface reduces requirements for artificial lighting the reflectivity of the skin reduces heat gain and the radiation of waste heat from the warm fabric surface to cool sky results in an energy efficient building in warm climates In cold climates a second skin or liner is often used often with glass fiber insulation in the cavity to further reduce heat loss In general as permanent structures tensioned fabric technology is underutilized There are many projects or parts of projects that could employ this system

Mechanics of Materials Christopher Jenkins, Sanjeev Khanna, 2005-03-15 The unifying treatment of structural design presented here should prove useful to any engineer involved in the design of structures A crucial divide to be bridged is that between applied mechanics and materials science The onset of specialization and the rapid rise of technology however have created separate disciplines concerned with the deformation of solid materials Unfortunately the result is in many cases that society loses out on having at their service efficient high performance material structural systems We follow in this text a very methodological process to introduce mechanics materials and design issues in a manner called total structural design The idea is to seek a solution in total design space The material presented in this text is suitable for a first course that encompasses both the traditional mechanics of materials and properties of materials courses The text is also appropriate for a second course in mechanics of materials or a follow on course in design of structures taken after the typical introductory mechanics and properties courses This text can be adapted to several different curriculum formats whether traditional or modern Instructors using the text for a traditional course may find that the text in fact facilitates transforming their course over time to a more modern integrated approach

BOOK JACKET Tension Structures Wanda J. Lewis, 2003 The tension structures discussed in this book are predominantly roofing forms created from pre stressed cable nets cable trusses and continuous membranes fabric structures A unique feature in their design is form finding an interactive process of defining the shape of a structure under tension The book discusses the role of stable minimal surfaces minimum energy forms occurring in natural objects such as soap films in finding optimal shapes of membrane and cable structures The discussion of form finding is extended to structural forms whose shape is supposedly known such as suspension bridge cables

Wind Engineering J. E. Cermak, 2013-10-02 Wind Engineering is a compendium of papers from the Fifth International Conference on Wind Engineering held in Colorado USA on July 8 14 1979 Papers discuss the social and economic impact of wind storms particularly the need for improvement in decision making in building construction development of design and construction criteria for low income housing Other papers describe snow management and microzonation studies to quantify with better precision the probabilities used in decision models Some papers describe localized wind environments and wind loading fluctuating internal fluctuating external Other papers analyze the dynamic response of tall buildings and towers such as in crosswinds wind direction alongwind and wind action with interference effects from similar surrounding buildings Experiments show that by properly modeling a structure in a boundary layer wind tunnel the investigator can obtain results
