The Hereditary Basis Of Allergic Diseases:

The Hereditary Basis of Allergic Diseases Stephen T. Holgate, John W. Holloway, 2012-12-06 Allergic diseases are complex and involve a range of environmental factors interacting with a susceptible genotype The familial clustering of diseases such as asthma and hay fever has been recognised for over two centuries but identification of the genetic basis to this had to await the molecular biological revolution Estimates of the contribution that genetic factors make to asthma susceptibility range from 35% to 70% For the majority of allergic diseases segregation analysis has not identified a consistent Mendelian pattern of inheritance which when combined with multiple phenotypes and environmental interactions has made identifying candidate genes especially difficult and at times controversial Part of the difficulty has been lack of agreement over phenotype definitions reduced power of studies to predict linkage and association and importantly lack of true heterogeneity between populations Despite these difficulties the last decade has witnessed enormous progress in this field

the Heat on Pain: TRPV1 Receptors in Pain and Inflammation Annika B. Malmberg, Keith R. Bley, 2006-01-17 Despite tremendous advances in the understanding of the sensory nervous system which have accompanied the recent explosive growth of the neurosciences remarkably few innovative medicines directed towards pain and inflammation are available Indeed many patients are still prescribed analgesic and anti inflammatory medications that were identified long ago as components of herbal remedies Similarly potential new medicines in clinical evaluation based on capsaicin and the capsaicin receptor are both grounded firmly on folk traditions and yet rely upon the most contemporary techniques of drug discovery and delivery The first formal report of the pain relieving properties of capsaicin appeared in 1850 1 However for centuries before this capsaicin containing extracts had been used as folk medicines in cultures with access to pepper plants much in the same way as poppy or willow bark extracts were Despite widespread use it was not until 1878 that the selective action of capsaicin on the sensory nervous system was recognized 2 In Chapter 1 of this volume Janos Szolcsanyi reviews this early research which culminated with the seminal studies of Nicholas Jancso and his colleagues in Hungary in the 1940s Since then capsaicin and related vanilloid compounds have played a prominent role in analgesia and inflammation investigations because of their ability to selectively activate a subpopulation of sensory neurons and produce sensations of pain and localized erythema *Allergy*
