

Solid Liquid Equilibrium

The *melting point* of a solid or the *freezing point* of a liquid is the temperature at which the solid and liquid phases coexist in equilibrium.

Molar heat of fusion (ΔH_{fus}) is the energy required to melt 1 mole of a solid substance at its freezing point.

$$\Delta H_{\text{fus}} = -\Delta H_{\text{solid}}$$

Solid-liquid Equilibrium Rolf Haase, H. Schönert, 1969 **Solid-liquid-equilibrium data collection** Helmut Knapp, 1987 Solid liquid equilibrium data collection Helmut Knapp, Matthias Teller, Ralph Langhorst, 1987

Solid-Liquid Equilibrium in Multi Solute Systems Izumi Kurosawa, 2004 Solid liquid equilibrium in isomorphous amino acid systems has been investigated as a model for systems that form solid solutions Solid and liquid phase compositions in L valine L leucine L valine L isoleucine and L isoleucine L valine in water were measured over the entire range of solid composition and it was shown from mass balance and phase rule considerations that these systems form solid solutions The solid phases resulting from isothermal and cooling crystallization experiments were also investigated using powder x ray diffractometry which showed that homogeneous solid solutions could only be obtained in cooling crystallization experiments whereas isothermal experiments generally produced inhomogeneous solids This suggests that data reported in the literature from isothermal experiments may not represent true equilibrium values Solid phase activity coefficients were estimated using binary and ternary equilibrium data and the UNIFAC Kuramochi model for liquid phase nonidealities The solid phases in the three systems investigated exhibited significant nonidealities that were correlated using the Margules model The model parameters exhibited a linear relationship with the ratio of binary solubilities of the two solutes Such simple relationship may be advantageous when solid liquid equilibrium of thermally unstable solutes or components with unknown physical properties are crystallized
