The African Trypanosomiases:

The African Trypanosomiases Hugh Waddell Mulligan, 1970 *Progress in Human African Trypanosomiasis, Sleeping Sickness* Michel Dumas, Bernard Bouteille, Alain Buguet, 2013-12-01 Human African Trypanosomiasis HAT or sleeping sickness is an old disease to be now considered as reemergent HAT is endemic in 36 sub Saharan African countries in areas where tsetse flies are found The public health importance of HAT is underestimated but the disease causes severe social disruption in many rural areas Along the past fifteen years numerous studies were made and now the mechanisms involved in the disease pathogenesis and in the characteristics of sleep wake disruption become to be better understood But since 50 years when current drugs were introduced problems regarding HAT chemotherapy have not been solved Nevertheless in depth studies about trypanosome metabolism have permitted to discover new drug targets Written by specialists who are very experienced in their respective fields the contributions provide an indispensable tool for practitioners and scientists

Human African Trypanosomiasis (Sleeping Sickness) Christian Burri, 2020-06-17 As it is a goal to eliminate human African trypanosomiasis HAT sleeping sickness as a public health problem by 2020 and interrupt transmission by 2030 this is a good moment to reflect on what we have achieved what we want to achieve and what could get in our way HAT has a reputation for spectacular reappearances and the latest peak of 40 000 reported and over 300 000 estimated cases only dates back to 1998 Efforts of the WHO and partners as well as the development of simpler and much better tolerated treatments improved diagnostics and vector control tools made it possible to reduce this number by 95% Case identification and confirmation remain complex and require specific skills treatment remains error prone and reports on long term survivors have emerged and the relevance of the animal reservoir for *T b gambiense* HAT needs clarification In addition to win the end game against this massively stigmatized disease the human factor will play a key role This Special Issue addresses many of the burning topics about disease elimination in its 12 research and 7 review articles and one case study The papers critically reflect the approaches used investigate the mentioned challenges and propose novel approaches and interventions from various points of view

The African Trypanosomes Samuel J. Black, J. Richard Seed, 2006-04-11 African trypanosomes are tsetse transmitted protozoa that inhabit the extracellular compartment of host blood They cause fatal sleeping sickness in people and Nagana a wasting and generally fatal disease in cattle While trypanosomes are most common to Africa about 30% of Africa's cattle graze on the fringe of the tsetse habitat some species have spread beyond its borders to Asia the Middle East and South America The African Trypanosomes volume one of World Class Parasites is written for researchers students and scholars who enjoy reading research that has a major impact on human health or agricultural productivity and against which we have no satisfactory defense It is intended to supplement more formal texts that cover taxonomy life cycles morphology vector distribution symptoms and treatment It integrates vector pathogen and host biology and celebrates the diversity of approach that comprises modern parasitological research

African Trypanosomiasis Gerald T. Hughes, 2016

Human African trypanosomiasis or sleeping sickness is caused by infection with the morphologically indistinguishable subspecies *Trypanosoma brucei rhodesiense* in East and Southern Africa and *Trypanosoma brucei gambiense* in West and Central Africa. The disease is presently almost under control and less than 4000 cases are currently reported. In both *T. b. rhodesiense* and *T. b. gambiense* infection, after the injection of infective metacyclic trypanosomes with tsetse fly vector saliva, the parasites establish in the skin, differentiate to the bloodstream stage, and spread via the local draining lymph node into the vascular system. In this book, Chapter One presents an overview of the current epidemiology, clinical features, diagnosis, and treatment options. Chapter Two provides an in-depth review of diagnostic methods for African trypanosomiasis. Chapter Three discusses the use of aminoadamantane derivatives against *Trypanosoma brucei*.

The African Trypanosomiasis, 1979. Control and Surveillance of Human African Trypanosomiasis, 2013. This report provides information about new diagnostic approaches, new therapeutic regimens, and better understanding of the distribution of the disease with high quality mapping. The roles of human and animal reservoirs and the tsetse fly vectors that transmit the parasites are emphasized. The new information has formed the basis for an integrated strategy with which it is hoped that elimination of HAT will be achieved. The report also contains recommendations on the approaches that will lead to elimination of the disease.

Human African Trypanosomiasis (HAT) is a disease that afflicts populations in rural Africa where the tsetse fly vector that transmits the causative trypanosome parasites thrives. There are two forms of HAT: one known as gambiense HAT is endemic in West and Central Africa and causes over 95% of current cases; the other known as rhodesiense HAT is endemic in East and southern Africa and accounts for the remainder of cases. The presence of parasites in the brain leads to progressive neurological breakdown. Changes to sleep/wake patterns are among the symptoms that characterize the disease, also known as sleeping sickness. Eventually, patients fall into a coma and die if not treated. Different treatments are available against parasites present in the haemolymphatic system (first stage) and those that have entered the brain (second stage). Currently, lumbar puncture is required to select the appropriate drug.

African Sleeping Sickness (African Trypanosomiasis). The U.S. Centers for Disease Control and Prevention (CDC) presents information on African sleeping sickness, also known as African trypanosomiasis, a systemic disease caused by the parasite *Trypanosoma brucei*. The CDC highlights the occurrence of the disease, the risk for travelers, and preventive measures.

Control and Surveillance of Human African Trypanosomiasis, World Health Organization, 2013. This report provides information about new diagnostic approaches, new therapeutic regimens, and better understanding of the distribution of the disease with high quality mapping. The roles of human and animal reservoirs and the tsetse fly vectors that transmit the parasites are emphasized. The new information has formed the basis for an integrated strategy with which it is hoped that elimination of HAT will be achieved.
