Epidemiology of Cancer of the Digestive Tract Pelayo Correa, W. Haenszel, 2012-12-06 The digestive organs are the most frequent site of cancer in the world accounting for approximately 30% of all malignant tumors This prominent position has been present for many decades in spite of marked shifts in the frequency of cancer of specific organs The most remarkable shift has been the decrease in gastric cancer rates occurring concomitantly with an increase in colon cancer rates in most western industrialized societies Important exceptions to this rule as well as other epidemiologic evidence indicate that the opposite trends for gastric and colon cancers are not inevitable consequences of each other Although genetically determined precancerous syndromes are well recognized it is generally agreed that environmental factors play

an overriding role in digestive cancer causation The most obvious environmental factors seem to be the result of what we eat drink or smoke Although the nutritional component of the diet is of unquestionable importance the nonnutrient elements in our diet have also proven to be influential causative factors Several studies have focused on the microenvironment at the level of the mucosa or the digestive organs as a micro cosmos where forces promoting and inhibiting carcinogenesis are operating for a prolonged period of time Their interaction eventually determines the presence or absence of a malignant tumor Our understanding of such modulating forces hopefully will someday allow us to modify the microenvironment in a favorable way and attain the goal of cancer prevention

Textbook of Cancer Epidemiology Hans-Olov Adami,David Hunter,Dimitrios Trichopoulos,2008-02-27 This superb text gives a concise systematic account of what is currently known about the epidemiology and primary prevention for most forms of human cancer Part 1 provides an introduction to basic concepts in epidemiology a description of the global burden of cancer definitions and characterizations of the various measures used and approaches used to reveal genetic determinants of cancer risk and integrate biologic markers in the epidemiologic research process Part 2 contains chapters of uniform structure on over 20 types of cancer providing clinical and pathological outlines descriptive epidemiology and a comprehensive account of risk factors and their etiological importance Specific sections address somatic and germ cell mutations that play a role in the occurrence of particular forms of cancer

The Prevention of Cancer Richard Doll,2017-07-05 Epidemiological studies show that cancer incidence is far more dependent on the conditions of life than previously supposed Classically cancers occurred with heavy exposure to a specific occupational hazard or were associated with habits In some instances research shows the incidence of cancer falls when the method of work or the associated habit is changed In short variation in incidence is now known to be the rule rather than the exception in cancer No cancer that occurs with even moderate frequency occurs everywhere and always to the same extent Sometimes it is even epidemic similar in scale to an epidemic of infectious disease but modified by the fact that the induction period may be as much as thirty years Prevention of cancer is now coming to be regarded as a practicable alternative to its cure We remain almost totally ignorant of how cancer is produced at the cellular level and until we know this our methods of prevention are liable to be cumbersome and inefficient Ethical considerations and the time scale of the disease make it impossible to obtain experimental evidence in man and what action to take has been determined from observing nature s experiments and by analogy from experiments in animals The evidence from epidemiological studies is of particular interest Such studies suggest relationships that would never be thought of in the ordinary course of laboratory work and results that are directly relevant to the problems of human disease The large numbers at risk and the intensity of the medical care to which people with cancer are subjected make it possible to recognize relatively small improvements Such practical decisions based on information thus obtained have largely eliminated the risk of cancer due to occupational hazards in several industries

Cancer Epidemiology and Prevention David Schottenfeld,Joseph F. Fraumeni Jr.,2006-08-24 This much

anticipated Third Edition provides a comprehensive presentation of the global burden and patterns of cancer occurrence along with new developments in our understanding of cancer causation and prevention. Special attention is given to epidemiologic approaches that incorporate molecular biomarkers based on genomic and other emerging technologies providing new insights into the role of genetic predisposition and gene-environment interactions in cancer induction. In addition, new chapters are included on social class disparities in cancer incidence and mortality, the role of obesity and physical inactivity in cancer etiology, the potential effects of electromagnetic fields and radiofrequency radiation, and the principles of cancer chemoprevention. The textbook is organized into five sections: Basic Concepts, The Magnitude of Cancer, The Causes of Cancer, Cancer by Tissue of Origin, and Cancer Prevention and Control. In this new edition, Drs. David Schottenfeld and Joseph F. Fraumeni Jr. have enlisted three distinguished Associate Editors: Drs. Jonathan Samet of Johns Hopkins University, Graham Colditz of Harvard University, and Alice Whittemore of Stanford University.
