Virtual Dreaming Ed Fergusson, Karl Patterson, 2008-11 This document is a summary of three clinical research studies exploring the benefits of virtual dreaming in therapeutic applications a study in pain management a study in post traumatic stress disorder and a study in insomnia Lucid Dreaming is the rare situation when a dreamer is aware they are dreaming and manages to remain asleep Often in these situations the dreamer has remarkable control of the environment and course of events within their dreams and this is also the goal in virtual dreaming The combination of the feeling of control involved in lucid dreaming and the comforting buffer of being aware one is only dreaming makes for an ideal therapeutic arena With the completion of the first clinical studies of the Virtual Dreaming technology interest in Virtual Dreaming as a new treatment for a range of neurological disorders has grown rapidly This book was produced in response to the growing interest in this new technology It is hoped that the information contained in this book will encourage others in the field to do more research into the applications and effectiveness of Virtual Dreaming

The Boundaries of Consciousness: Neurobiology and Neuropathology Steven

Laureys, 2006-08-24 Consciousness is one of the most significant scientific problems today. Renewed interest in the nature of consciousness, a phenomenon long considered not to be scientifically explorable, as well as increasingly widespread availability of multimodal functional brain imaging techniques (EEG, ERP, MEG, fMRI, and PET) now offer the possibility of detailed integrated exploration of the neural, behavioral, and computational correlates of consciousness. The present volume aims to confront the latest theoretical insights in the scientific study of human consciousness with the most recent behavioral, neuroimaging, electrophysiological, pharmacological, and neuropathological data on brain function in altered states of consciousness, such as brain death, coma, vegetative state, minimally conscious state, locked-in syndrome, dementia, epilepsy, schizophrenia, hysteria, general anesthesia, sleep, hypnosis, and hallucinations. The interest of this is threefold. First, patients with altered states of consciousness continue to represent a major clinical problem in terms of clinical assessment of consciousness and daily management. Second, the exploration of brain function in altered states of consciousness represents a unique lesional approach to the scientific study of consciousness and adds to the worldwide effort to identify the neural correlate of consciousness. Third, new scientific insights in this field have major ethical and social implications regarding our care for these patients.
