

What is Permafrost?

Definition

Permafrost is defined as ground, soil or rock, including ice or organic material, that remains at or below 0°C for at least two consecutive years.

The regions in which permafrost occurs occupy approximately 24% (23 million km²) of the northern hemisphere.

Permafrost is formed when the ground cools down in winter and produces a frozen layer below the surface that then remains frozen throughout the following summer, or longer.
