The Oxidative Balance:

The Oxidative Balance David A. Leaf, Peter A. Glassman, 2000-01-01 **The Molecular Genetics of Aging** Siegfried Hekimi, 2012-12-06 The molecular genetics of aging or life span determination is an expanding field One reason is because many people would consider it desirable if human life span could be extended Indeed it is difficult not to be fascinated by tales of the life and death of people who have succeeded in living a very long life Because of this we have placed at the head of this book the chapter by Perls et al on Centenarians and the Genetics of Longevity Perls and his coauthors convincingly argue that while the average life expectancy might be mostly determined by environmental factors because the average person has an average genotype extremely long life spans are genetically determined Of course studying humans to uncover the genetics of aging is not ideal not so much because one cannot easily perform experiments as because they live such a long time This is why most of this book describes the current state of research with model organisms such as yeast worms flies and mice J aswinski focuses on yeast and how metabolic activity and stress resistance affect the longevity of *Saccharomyces cerevisiae* In the process he discusses the concept of aging as applied to a unicellular organism such as yeast and the importance of metabolism and stress resistance for aging in all organisms **Understanding Obesity to**

Determine the Best Therapeutic Option: From Lifestyle Interventions to Therapies Evelyn Frias-Toral, Jorge Carriel-Mancilla, Florencia Ceriani, Almino Ramos, 2025-02-21 We are currently facing an obesity pandemic that affects individuals of all age groups geographic areas and social status among others Thus it is essential to generate high quality scientific evidence to better understand this pathology its risk factors and its treatments Several modifiable and non modifiable risk factors for the development of obesity have been identified It has been demonstrated that obese patients have an increased risk of acquiring arterial hypertension diabetes dyslipidemia cardiovascular diseases cancer and other chronic conditions In order to take efficient actions to reverse or prevent these complications it is also crucial to delve into body composition lean mass fat bone mass and sarcopenia in patients with obesity In recent months there have been developments in pharmacological therapies using GLP 1 GIP and glucagon agonists which seem to change the rules of the game regarding therapeutic decision making in these patients worldwide However surgical techniques such as sleeve gastrectomy and Roux en Y gastric bypass continue to be the most effective and definitive interventions to achieve adequate weight loss in patients with obesity Despite the pharmacological development none of the clinical trials have shown that the operated patients reach more than 30% of the total body weight as with bariatric surgery techniques Furthermore it is fundamental to analyze the impact of diverse therapeutic non surgical and non pharmacological options to address obesity such as cognitive behavioral interventions and different types of diets in combination with physical activity **Critical Reviews of Oxidative Stress**

and Aging Richard G. Cutler, Henry Rodriguez, 2003 This two volume reference examines the translational research field of oxidative stress and ageing It focuses on understanding the molecular basis of oxidative stress and its associated age related

diseases with the goal of developing new methods for treating the human ageing processes

Ethanol, Its Active Metabolites, and Their Mechanisms of Action: Neurophysiological and Behavioral Effects Elio Acquas, John D. Salamone, Mercè Correa, 2018-07-12 Ethanol the main psychopharmacologically active ingredient of alcoholic drinks represents a paradigmatic example of a research subject intrinsically able to perpetually self generate interdisciplinary cutting edge investigations This eBook was inspired by the aim of providing an up to date characterization of the diverse effects of ethanol of the possible mechanisms of action on different intracellular systems as well as of the hypothesized actions of ethanol and or its metabolites on various neurotransmitters and neuromodulators Indeed the eBook provides a factual example of an excellent synthesis on the complex relationship between ethanol and its main biologically active metabolites Chapter 1 on the behavioral and molecular consequences of early exposure to them Chapter 2 on the recent proposals advanced by the preclinical research for new therapeutic approaches to distinct aspects of alcoholism Chapter 3 and on the most recent and original preclinical evidence of the interactions between ethanol and or its metabolites and the dopaminergic adenosinergic and endocannabinoidergic systems Chapter 4 Overall we believe that this eBook accomplishes its main goals of widening the perspective on this research subject and offering the readership a newer and simultaneously up to date and comprehensive scenery on ethanol s and ethanol s active metabolites neurophysiological and behavioral effects

Micronutrients, Immunity and Infection Philip Calder , Sladjana Sobajic, 2025-10-03 Many micronutrients vitamins and minerals have clearly identified roles in supporting the function of cells of the immune system People with micronutrient deficiencies often have immune impairments and are susceptible to infections and to infections being severe even fatal In such individuals micronutrient supplements can reverse immune impairments and reduce the risk of infections Nevertheless the relationships between micronutrient status immunity and infection are complex some micronutrients that are required by the immune system such as iron can also increase the risk of certain infections probably because those micronutrients favor pathogen growth and survival Furthermore the acute phase

response to infections alters micronutrient metabolism This makes understanding of the relationship between micronutrient status and infection more complicated COVID 19 increased interest in micronutrients including vitamins C and D and zinc amongst others in the context of immunity and infection but the findings of different studies have been inconsistent highlighting the complexity of this field This Research Topic welcomes manuscript submissions on micronutrients immunity and infection These may be mechanistic studies conducted in controlled settings such as in cell culture or experimental animals human epidemiological studies and trials in human participants and patients evaluating relationships between micronutrient exposure immune outcomes and infection and the underlying mechanisms

Assessment of Nutritional Status in Chronic Diseases Olivia Di Vincenzo ,Mariacristina Siotto,2025-09-22 Malnutrition undernutrition is defined as a state consequent to a lack of intake or uptake of nutrition that leads to altered body composition reduced physical and cognitive function and impaired clinical outcome from disease A poor nutritional status is common in patients affected by chronic diseases and may negatively affect diagnosis prognosis and the clinical course of disease Thus the assessment of nutritional status plays a crucial role in the management of chronic diseases It involves a multidimensional approach including different factors such as dietary intake anthropometric measurements biochemical markers and clinical evaluation Anthropometric measurements and body composition offer valuable insights into the assessment of nutritional status and risk of complications In addition biochemical markers provide objective data on nutritional deficiencies and metabolic abnormalities Factors such as inflammation and comorbidities can influence nutritional biomarkers necessitating careful interpretation

Rodent model organisms: Human diets and the gut microbiome Ren-You Gan,Naga Betrapally,Hesong Wang,2025-10-31 The microbiome plays an indispensable role in our health Pathophysiological alteration in the gut microbiota has been linked with the development and maintenance of non communicable diseases such as obesity cancer type 2 diabetes mellitus cardiovascular diseases and metabolic syndrome Dietary habits have a strong influence on the selection of gut microbiota Diet has a primary role over other factors such as age gender geography and environment in shaping the human gut microbiota Nutrients from the traditional foods used in different countries and culture directly interact with human gut microorganisms to promote or inhibit their growth and subsequently play a major role in overall health There has been also increasing evidence that microorganisms with claimed

probiotic properties can exert benefits for human health in different age groups by modulating action on host metabolism physiology nutrition and immune functions In order to better investigation the interaction between diet and microbiota and given the practical and ethical complexity of performing invasive sampling procedures in human subjects high inter individual variation in the diets and in the gut microbiomes of humans and relative ease of using animals with controlled diets for large scale mechanistic and genotypic research studies different types of animals models including rodents mice rats guinea pigs and hamsters rabbits pigs zebra fish and non human primates NHPs e g macaques and vervet monkeys have been developed and are frequently used to investigate the multiple dynamics of host microbiome interactions Among these rodents specifically mice and rats remain the most widely used models for studying the dynamics of host gut microbiome interaction in host nutrition and disease development and are convenient models for exploring avenues for developing novel microbial therapies To characterize human gut microbiota murine models have been hence widely used due to the extensive similarities in anatomy physiology and genetics Rodents represent the most used model for studying the impact of microbiota on its host particularly mouse and rats models that are the most widely used animal models for exploring the roles of human gut microbiota and are often used as model organisms for these studies This Research Topic welcomes Original Research Reviews Mini reviews and Perspective articles related to studies performed in mouse rat models and addressing but not limited to the following sub topics The influence of dietary habits in the selection of gut microbiota The interaction between diets and gut microbiota along with the health consequences The impact of a high fat sugar diet in the intestinal microbiota composition The use of probiotic microorganisms as adjuvants in the treatment or prevention of non communicable diseases like obesity and diabetes The impact of specific food and beverages on the corresponding alterations in the gut microbiota
