Food and Drink in American History Andrew F. Smith, 2013-10-28 This three volume encyclopedia on the history of American food and beverages serves as an ideal companion resource for social studies and American history courses covering topics ranging from early American Indian foods to mandatory nutrition information at fast food restaurants The expression you are what you eat certainly applies to Americans not just in terms of our physical health but also in the myriad ways that our taste preferences eating habits and food culture are intrinsically tied to our society and history This standout reference work comprises two volumes containing more than 600 alphabetically arranged historical entries on American foods and beverages as well as dozens of historical recipes for traditional American foods and a third volume of more than 120 primary source documents Never before has there been a reference work that coalesces this diverse range of information into a single set The entries in this set provide information that will transform any American history research project into an engaging learning experience Examples include explanations of how tuna fish became a staple food product for Americans how the canning industry emerged from the Civil War the difference between Americans and people of other countries in terms of what percentage of their income is spent on food and beverages and how taxation on beverages like tea rum and whisky set off important political rebellions in U S history

Wittenmayer, 2006-05-18 The world's population is expected to reach 8 billion by 2025 and most of this growth in population will occur in developing countries To feed the world with such a marked increase in population a great improvement in food production must be achieved particularly in these countries To meet this challenge present agricultural productivity must be increased on the cultivated land However in many developing countries particularly in Africa reduced soil fertility caused by continuous cropping with low nutrient input and the resultant nutrient mining of soils is a major threat both to food production and to ecosystem viability As a result of declining soil fertility together with increasing population pressure expansion of crop production to marginal lands and forested areas contribute to the

destruction of natural ecosystems Food production is not only a quantitative challenge Improving the nutrient status of plants provides a further valuable means of enhancing food quality and is of extreme benefit to the health of both plants and humans There are several excellent examples showing that plants with optimum nutrient status are better adapted to biotic and abiotic stress factors Because of population pressures many global food systems are not currently providing enough micronutrients to ensure adequate micronutrient intakes in the human diet This has resulted in an increasing prevalence of micronutrient deficiencies that now afflicts over three billion people worldwide
