The Pericardium Developments In Cardiovascular Medicine:

The Pericardium Ralph Shabetai, 2013-11-10 Many noteworthy advances in our knowledge of the pericardium its functions and diseases and their relation to heart failure have been made since the first edition of this book appeared in 1981 and no other book that covers in detail the physiology and pathophysiology has since been published The first edition was favourably received and I have frequently been asked to write a new edition My own knowledge in the years that have passed since then and my clinical and research experience in the field of the subject have both increased For all these reasons I decided that the second edition was overdue The long time that has elapsed between editions necessitated rewriting rather than simply revising most of the text For the same reason many of the figures are new Most of the references I have cited appeared in the literature after 1981 but I have retained a number of earlier ones either because they are classics or in my opinion have not yet been bettered It is my hope that the new edition will be a useful resource for clinicians called upon to manage patients with pericardial disease and for physiologists when the pericardium is relevant to their investigations I make no apology for the in depth treatment of the pericardial physiology and pathophysiology throughout the book for they are the foundation on which diagnosis hemodynamic and imaging studies and management must rest **Cardiovascular**

Mesothelial Physiology and Pathophysiology Sotirios G. Zarogiannis, 2018-11-02 The mesothelium is composed by a single layer of mesothelial cells that vest the serosal cavities pleural, peritoneal and pericardial and internal organs of the body. The mesothelial cells have a mixed phenotype of epithelial cells and fibroblasts, rendering them remarkable plasticity. Besides providing a slippery surface for the frictionless movement of internal organs, the mesothelium participates in a wide range of physiological and pathophysiological processes. Some of its functions include lung development, trans cellular and para cellular transport of ions and water, secretion of glycoproteins, mainly hyaluronan, secretion of cytokines and growth factors, wound healing response to inflammatory stimuli and induction of inflammation, mesothelial to mesenchymal transition and formation of tunneling nanotubes. Many of these functions are pivotal to physiological conditions such as respiratory development, maintenance of steady volume of serosal fluids and serosal permeability, cell to cell communication, re mesothelialization of serosal membranes after mechanical e.g. by asbestos or nanoparticles or inflammatory injury and participation in immune responses. Deviation from the physiological threshold of these functions results in the development of serosal effusions, induction of serosal and lung fibrosis, induction of mesothelial tumorigenesis, leading thus to devastating pathologies. Treatment of pathologies like mesothelioma, pleural and peritoneal fibrosis in cases of patients under Peritoneal Dialysis or lung fibrosis still pose a great challenge for researchers.
