Summary **Objectives:** The prevalence of cigarette smoking among Japanese men has been consistently high compared with males in Western countries over the past 30 years. However, during the same period, the incidence and mortality rates for lung cancer have been consistently lower in Japan than in Western countries, which has been termed the 'Japanese smoking paradox'. The odds ratio/relative risk of cigarette smoking for lung cancer mortality and incidence for the same number of cigarettes smoked per capita in Japan have been lower than those in Western countries. This difference in the odds ratio/relative risk is likely to be the main reason for the Japanese smoking paradox. The aim of this study was to clarify the reason for the difference in the odds ratio/relative risk between Japan and the USA. **Study design:** Literature review to compare environmental, hereditary and other factors that may be related to lung cancer in Japan and the USA. **Results and conclusions:** The main factors likely to have brought about the difference in the odds ratio/relative risk between Japan and the USA (and perhaps other Western countries as well) are: lower alcohol consumption by Japanese males;

Changes in Cigarette-related Disease Risks and Their Implication for Prevention and Control, 1997 This volume presents results from three large more contemporary prospective mortality studies and provides longer followup for two of the older studies dating from the 1950 s

When observations from the more contemporary studies are compared with those from the 1950 s one important but disturbing conclusion is apparent mortality risks among continuing smokers both males and females have increased In fact relative risks for smokers compared to never smokers have increased for all major smoking related diseases coronary heart disease CHD lung cancer other smoking related cancers stroke and chronic obstructive pulmonary disease COPD This increase over time in the relative risks for smokers compared to never smokers has occurred despite a dramatic decline in cardiovascular disease CVD death rates in the U S population suggesting that the decline in CVD death rates has been proportionately greater among never smokers than among continuing smokers The clearest message that is drawn from the enormous quantity of data presented in this monograph is that smoking prevention and cessation efforts are complementary not alternative solutions to the current epidemic of diseases caused by smoking
