Factors of Soil Formation Hans Jenny, 1994-01-01 Masterpiece offers a detailed discussion of the nature of the earth s terrestrial environment and a method of subdividing and studying it 1941 edition **Soil Formation** Nico van Breemen, Peter Buurman, 2007-08-20 Soils form a unique and irreplaceable essential resource for all terrestrial organisms including man Soils form not only the very thin outer skin of the earth's crust that is exploited by plant roots for anchorage and supply of water and nutrients Soils are complex natural bodies formed under the influence of plants microorganisms and soil animals water and air from their parent material i e solid rock or unconsolidated sediments Physically chemically and mineralogically they usually differ strongly from the parent material and normally are far more suitable as a rooting medium for plants In addition to serving as a substrate for plant growth including crops and pasture soils play a dominant role in the biogeochemical cycling of water carbon nitrogen and other elements influencing the chemical composition and turnover rates of substances in the atmosphere and the hydrosphere Soils take decades to millennia to form We tread on them and do not usually see their interior so we tend to take them for granted But improper and abusive agricultural management careless land clearing and reclamation man induced erosion salinisation and acidification desertification air and water pollution and withdrawal of land for housing industry and transportation now destroy soils more rapidly than they can be formed Formation Nico van Breemen, Peter Buurman, 2002-09-30 Soil Formation deals with qualitative and quantitative aspects of soil formation or pedogenesis and the underlying chemical biological and physical processes. The starting point of the text is the process and not soil classification Effects of weathering and new formation of minerals mobilisation transport and breakdown or immobilisation of dissolved and suspended compounds are discussed Soil processes and profiles are discussed in relation to the landscape the geosphere and the biosphere Emphasis lies on the universality of soil forming processes in past and present and on the soil as a dynamic entity that forms part of the total environment Complexity of genetic processes in time and space is given much attention. The text gives many examples from literature and places some in a new light. The reader is guided through the subject matter by a large number of questions and problems to help understand and synthesis the material Answers to all questions are included This second edition has been updated to reflect recent discoveries Printing errors have been corrected and new photographs support the text Hydrogeology, Chemical Weathering, and Soil Formation Allen Hunt, Markus Egli, Boris Faybishenko, 2020-12-31 Explores soil as a nexus for water chemicals and biologically coupled nutrient cycling Soil is a narrow but critically important zone on Earth's surface It is the interface for water and carbon recycling from above and part of the cycling of sediment and rock from below Hydrogeology Chemical Weathering and Soil Formation places chemical weathering and soil formation in its geological climatological biological and hydrological perspective Volume highlights include The evolution of soils over 3 25 billion years Basic processes contributing to soil formation How chemical weathering and soil formation relate to water and energy fluxes The role of pedogenesis in
