

## Soft X-ray Projection Lithography

*N. M. Ceglio*

Advanced X-ray Optics program  
Lawrence Livermore National Laboratory

We envision a modular, soft x-ray projection lithography system exposing high-density integrated circuits (minimum feature size  $\leq 1 \mu\text{m}$ ) at competitive production rates ( $\sim 100$  6" wafers/minute) before the end of this decade. The system is driven by a small-scale, high (average) power laser which generates x-rays from a laser-produced plasma, Figure 1. A narrow spectral band of x-rays in a ring-field illumination pattern onto an x-ray reflection mask. The reflection mask is simply a thin, metallized, integrated circuit (IC) pattern atop a multilayer-coated, highly polished, flat silicon substrate. The x-rays reflected from the mask are collected by a set of high-precision, Multilayer-coated wafer. The exposure at the wafer is in a ring-field pattern, and the entire IC pattern is replicated by synchronously scanning the mask and wafer, i.e., a step-and-scan exposure.

Figure 1: We envision a modular Soft X-ray Projection Lithography facility for the fabrication of 0.1  $\mu\text{m}$  design-rule devices before the end of this decade.

### **Optical Technologies for Extreme-Ultraviolet and Soft X-ray Coherent Sources** Federico Canova,Luca Poletto,2015-08-17

The book reviews the most recent achievements in optical technologies for XUV and X ray coherent sources Particular attention is given to free electron laser facilities but also to other sources available at present such as synchrotrons high order laser harmonics and X ray lasers The optical technologies relevant to each type of source are discussed In addition the main technologies used for photon handling and conditioning namely multilayer mirrors adaptive optics crystals and gratings are explained Experiments using coherent light received during the last decades a lot of attention for the X ray regime Strong efforts were taken for the realization of almost fully coherent sources e g the free electron lasers both as independent sources in the femtosecond and attosecond regimes and as seeding sources for free electron lasers and X ray gas lasers In parallel to the development of sources optical technologies for photon handling and conditioning of such coherent and intense X ray beams advanced New problems were faced for the realization of optical components of beamlines demanding to manage coherent X ray photons e g the preservation of coherence and time structure of ultra short pulses
