Blanc, 2013-03-09 Since the first edition of this book appeared in 1990 planetology has seen a number of fascinating discoveries that have increased our knowledge of the Solar System These have come from

both ground and space based observational programmes Although some space probe missions have ended in failure even they have added to our store of information about the planetary environment The Galileo probe despite being crippled by its incompletely deployed main antenna has already achieved some spectacular results For the first time we have obtained pictures of asteroids with the images that Galileo returned of Gaspra Ida and the latter's satellite Dactyl The main objective the dropping of an instrumented capsule into Jupiter's atmosphere and prolonged in situ investigation of the planet will take place at the end of 1995 Saturn's turn will come early in the next century with the Cassini mission to be launched in 1997 which will study the planet for an extended period and attempt to land the Huygens probe on the surface of Titan NASA's Magellan mission proved to be a great success with its highly detailed radar mapping of the surface and atmospheric studies The exploration of Mars was less fortunate with the failure of both space probes of the Soviet Phobos mission as well as NASA's Mars Observer probe Despite this setback plans are in hand for future collaborative exploration of the planet using both surface stations possibly active rovers surface penetrators and balloon probes as well as orbiters
