on the physical characteristics of hydrated minerals the potentially H₂O rich transition zone 410 660 km depth and our detection abilities Integrated perspectives from four fields of research are featured Mineral physics and geochemistry Seismology and electrical conductivity Properties of deep hydrous mantle Global models and consequences of a deep Earth water cycle From experimental synthesis and physical properties measurements to geophysical observations and geodynamic modeling we are beginning to understand what parameters and data are needed to detect or refute the possibility of water in the deep Earth
