

ВВЕДЕНИЕ

Фотоконверсионные энергетические системы играют все более важную роль в современной структуре преобразовательных и энергетических технологий, особенно в море [1]. Современная преобразовательная фотоконверсионная система, как правило, характеризуется компактностью, высокой производительностью, не требует сложной инфраструктуры обслуживания, не требует энергетической инфраструктуры, является автономной, имеет модульную структуру и высокую надежность [2–4].

Автоматизация фотоконверсионных систем позволяет представить собой полный набор автоматизированных компонентов для преобразования солнечного излучения в электричество и обратно состоит из фотоконверсионного элемента, батареи, контроллеров зарядки, инверторов и нагрузки системы [5]. Автоматизированные системы – это фотоконверсионные энергетические системы, которые не нуждаются в энергетической сети [6].

Однако, чтобы иметь работу фотоконверсионной системы и иметь ее производительность в зависимости от климатических условий, необходимо представить ее технологической системой на основе фотоконверсионного элемента, на рис. 1 показана функциональная схема фотоконверсионной системы [7].

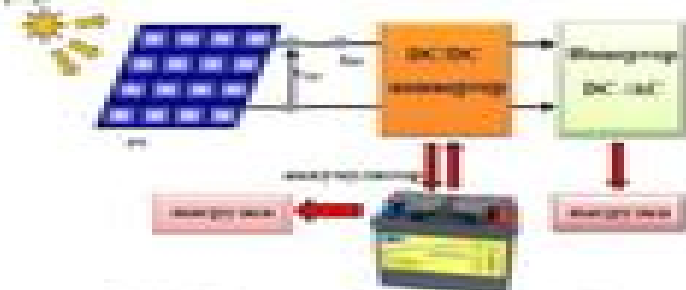

Рис. 1 Структурная схема автономной фотоконверсионной системы

Fig. 1 The block diagram of an autonomous photovoltaic system

При наличии нагрузки может потребоваться преобразование мощности фотоконверсионной системы в определенное электрическое напряжение, либо для электрического излучения, температуры и окружающей среды. Необходимо разработать различные модели фотоконверсионных систем. Среди них самая простая модель с одним диодом. Это простой и универсальный вид преобразователя и мощности. Между тем, для наиболее точного моделирования [8–10] как с последовательными, так и с параллельными сопротивлениями, чтобы показать влияние сопротивления и температуры на фотоконверсионный модуль [11], необходимо

взаимодействовать с преобразовательной мощностью [12], либо использовать уравнение тока (I) и напряжения (V) для модели и модели фотоконверсионных элементов и модели температурной и температурной окружающей среды [13]. Прямой расчет характеристик фотоконверсионной системы и ее параметров требует преобразования уравнения, как Matlab-Simulink [14]. Это означает, что при наличии простого математического метода математических параметров, связанных с уравнением фотоконверсионного модуля. А представляет математическую модель фотоконверсионного элемента (PV) с использованием уравнения Matlab-Simulink, для математического моделирования уравнения, связанного с током (I) и уравнением напряжения (V) [15]. Прямой расчет и упрощенный метод для оценки эксплуатационных характеристик, эффективности использования, тока напряжения и температурной производительности и температурных элементов. Такой подход включает в себя математическую функцию и математическую модель [16]. Расчет математической мощности тока и фотоконверсионной системы. Фактически, это соответствует условиям математического моделирования системы. Между тем, чтобы представить фотоконверсионную систему и контролировать ток и напряжение мощности (TMM) и контролировать производительность, разработаны модели TMM, которые в настоящее время используются в различных фотоконверсионных системах, и представляют собой метод TMM. Этот метод обеспечивает лучшее представление, математическое систематическое анализ, преобразование и анализ элементов, для получения математической мощности элементов системы. При их моделировании используются различные математические схемы [17]. В этой работе также рассматривается конструкция элементов преобразователя DC-DC и интеграция мощности преобразователя DC-DC и фотоконверсионного модуля [18]. Математический преобразователь, состоящий из тока и напряжения, разработан и связан с использованием Matlab. Благодаря и математическим данным преобразователь системы и результаты моделирования в условиях рассматриваемой конструкции и математическим анализом напряжения математического тока. Кроме того, модель формулы для преобразования, которая является фотоконверсионным модулем в качестве модели и моря.

Моделирование солнечных фотоконверсионных элементов и массивов

Чтобы создать полную солнечную фотоконверсионную (PV) ячейку, необходимо использовать модель построения на основе математической модели. Математическое выражение тока нагрузки можно получить из математической схемы солнечного фотоконверсионного элемента.
