Milton Lionel Berliner, 1943 Atlas of the Slitlamp-Microscopy of the Living Eye Alfred Vogt, Robert von der Heydt, 1921
The introduction of the slitlamp of Gullstrand has opened to ophthalmology an entirely new field for clinical observation and diagnosis. It has created what may be termed an Histology of the living eye. Normal and pathologic conditions heretofore established only anatomically can be directly observed in the living eye. It shows us not only structures that are known but in addition a series of observations on histological details heretofore impossible. These structures owing partly to their delicacy were formerly sacrificed in the process of fixation or it was impossible to further differentiate them by any method of staining. For instance we have up to the present failed of anatomical proof of the numerous physiologic remnants of the tunica vasculosa lentis, the arteria hyaloidea, the various intricacies of the framework supporting the vitreous body, types of lens sclerosis, etc. but the number of facts already known as a result of anatomical research which have hitherto evaded clinical confirmation is far greater. The slitlamp in combination with the corneal microscope permits us to observe the living endothelium on the posterior surface of the cornea. Every individual endothelial cell on Descemet's membrane as well as each pathologically deposited lymphocyte is revealed. The nerve fibres of the cornea can be traced to their very finest ramifications. In Descemet's and Bowman's membranes we have observed pathological folds manifested by their characteristic reflexes. **Slit-Lamp Microscopy of the Living Eye** Dr. P.
