Soft Tissue Sarcomas: Present Achievements and Future Prospects J. Verweij, H.M. Pinedo, H.D. Suit, 2012-12-06

The previous volumes in this series on soft tissue sarcomas highlighted the importance of the multidisciplinary approach to treatment and this focus is continued in the present volume. Proper diagnosis and staging remain the cornerstone of the treatment strategy. Sophisticated histopathology techniques and growing consensus on grading systems have further increased the importance of the histopathologist in providing estimates of patient prognosis as well as in providing data for planning the treatment strategy. The use of cytogenetics in this field is rapidly increasing and might enable the distinction of subgroups in specific histological tumor types. Furthermore, molecular biological studies not only help reveal inherited predispositions and details in tumor oncogenesis but they may also provide additional predictive factors for tumor behavior. Further data on treatment strategy will be provided by diagnostic imaging and in this volume the value of PET imaging, a relatively new achievement, is highlighted. As far as the actual treatment is concerned, surgery still provides the major opportunity for cure. The addition of radiotherapy to surgery is of utmost importance in efforts to spare as much tissue as possible. The chapters on the planning of radiotherapy, brachytherapy, and the treatment of benign soft tissue lesions using radiotherapy are new contributions to this book. One of the potential late problems of radiotherapy is the occurrence of secondary soft tissue sarcomas, which is discussed in Chapter 10.

Brain Metastases Jeffrey J. Raizer, Lauren E. Abrey, 2007-10-23

Brain metastases are the most dreaded complication of systemic cancer affecting approximately 170 000 people a year, a far greater incidence than primary

brain tumors Advances in modern chemotherapy have led to an improved control of system cancers often with agents that poorly penetrate the central nervous system resulting in an increasing incidence of brain metastases Traditional chemotherapy has had little impact on brain metastases The main therapeutic option is radiation therapy and in a small number of patients surgery However refinements in all of these treatments offer some positive outcomes and an increased ability to stratify patients based on certain criteria This book will bring current information on the presentation and management of patients with brain metastases providing available data giving guidelines that can be applied in day to day practice updated information for neuro surgeons radiation oncologists medical oncologists and neuro oncologists as well as an overview for physicians in training *Cancer Clinical Trials: Proactive Strategies* Stanley P. L. Leong, 2007-05-14 Clinical trials remain the most important vehicle for improving the care of cancer patients This text presents the fundamental components and challenges involving clinical investigations Leading experts discuss the critical issues covering the spectrum of important topics from planning to application The book has a foreword by Samuel A Wells Jr MD Professor of Surgery Duke University Medical Center Durham NC former Director of the American College of Surgeons and Founder of the American College of Surgeons Oncology Group **Rare Hematological Malignancies** Stephen M. Ansell, 2007-11-17 Many comprehensive text books have been written about the common hematologic malignancies However every practicing hematologist oncologist or primary care physician intermittently encounters patients with uncommon or rare hematologic malignancies Information concerning these diseases and particularly regarding their management is extremely difficult to find Physicians will commonly spend a substantial period of time searching the medical literature for help or will call a colleague who may have greater expertise in the area *Rare Hematological Malignancies* covers malignant hematologic diseases that physicians would see only occasionally providing accurate up to date information on the disease biology and practical recommendations concerning the disease management *The Link Between Inflammation and Cancer* Angus G. Dalgleish, Burkhard Haefner, 2006-03-05 A link between inflammation and cancer has been established many years ago yet it is only recently that the potential significance of this connection has become apparent Although several examples of chronic inflammatory conditions often induced by persistent irritation and or infection developing into cancer have been known for some time there has been a notable resistance to contemplate the possibility that this association may apply in a causative way to other cancers Examples for such progression from chronic inflammation to cancer are colon carcinoma developing with increased frequency in patients with ulcerative colitis and the increased incidence of bladder cancer in patients suffering from chronic Schistosoma infection Inflammation and cancer have been recognized to be linked in another context for many years i e with regards to pathologies resembling chronic lacerations or wounds that do not heal More recently the immunology of wound healing has given us clues as to the mechanistic link between inflammation and cancer in as much as wounds and chronic inflammation turn off local cell mediated immune responses and switch on growth factor release as well

the growth of new blood vessels angiogenesis Both of these are features of most types of tumours which suggest that tumours may require an immunologically shielded milieu and a growth factor rich environment

Hematopathology in Oncology William G. Finn,LoAnn C. Peterson,2006-04-18 Hematologist oncologists rely heavily upon the discipline of hematopathology for the care and management of their patients Whether interpreting a lymph node or bone marrow biopsy directing a high throughput automated hematology laboratory or translating testing modalities from the research bench to the clinical laboratory hematopathologists and other laboratory medicine specialists provide a steady stream of critical data for the clinical practitioner Recently the rapid advances in diagnosis and treatment of hematological disorders including the need to evaluate patients eligibility for and monitor responses to rapidly evolving targeted therapies have made the close collaboration between pathologists and clinician practitioners even more essential Our goal is to provide outstanding reviews of selected topics in hematopathology in a format that provides both general and historical background as well as an overview of the state of the art in diagnostic hematopathology with an eye on future potential and future developments

Biological Basis of Geriatric Oncology Lodovico Balducci,Martine Extermann,2006-06-14 Biological Basis of Geriatric Oncology highlights research issues that are specific to geriatric oncology in the field of carcinogenesis and cancer prevention and treatment based on the biologic interactions of cancer and age It illustrates the benefit of the principles of geriatrics in the management of cancer in the older individual This volume provides a frame of reference for practitioners of any specialties involved in the management of older patients and for oncologists involved in the management of cancer of older individuals It is a source for basic and clinical scientists exploring the interactions and emerging information of cancer and aging

Molecular Basis of Thyroid Cancer NADIR R. FARID,2006-02-03 This series is indexed in index Medicus The turn around time for this series is fast making the research as accurate as a journal

Leptomeningeal Metastases Lauren E. Abrey,Marc Chamberlain,Herbert Engelhard,2006-03-30 Leptomeningeal Metastases is intended to provide the reader with an overview of the state of the art therapy for the cancer patient with leptomeningeal cancer with additional information on epidemiology symptom management new clinical trials and current basic research in animal models for experimental therapies

Cytokines and Cancer Leonidas C. Platanias,2006-05-06 Dramatic advances have occurred over the last few years in the research field of cancer biology There has been a constant accumulation of important new information resulting in a gradual transformation on the perceptions that exist among scientists regarding mechanisms by which the malignant phenotype develops The recent developments in cancer research have also had a substantial impact in efforts towards the development of new cancer therapies One of the most explosive and rapidly advancing research areas has been the area of cytokines and cancer Many perceptions have changed from the original discovery decades ago of the interferon to the current state of the art cytokine research It is now well recognized that many cytokines play important roles in normal cellular functions while some of them have prominent roles in the pathophysiology of cancer It is also now firmly established

that several cytokines promote the growth of cancer cells while others act as suppressors of malignant cell proliferation The importance of the cytokine signaling field in cancer is reflected by the development of multiple treatments that have been introduced in clinical oncology over the last few years Understanding the physiological functions of cytokines as well as their precise roles in the pathogenesis of certain malignancies is extremely important in the current clinical era Advances in Breast Cancer Management William J. Gradishar, William C. Wood, 2007-11-29 This volume highlights many of the important advances that have improved our understanding of the biology and therapeutics of breast cancer The initial discussion focuses on the evolving understanding of the genetics of breast cancer In addition to the well known genetic mutations BRCA1 and BRCA2 other mutations that have recently been identified are discussed *Thoracic Oncology* David S. Ettinger, 2012-12-06 In the United States alone the incidence of new cases of thoracic neoplasms is over 180 000 Each year over 170 000 individuals are expected to die of their cancer Lung cancer is the most common of the thoracic neoplasms It is the leading cause of cancer death in both men and women accounting for 28% of all cancer deaths in the United States Thoracic Oncology provides an up to date and concise review of the various thoracic neoplasms and offers a better understanding of the biology natural history diagnosis and treatment of these malignancies This book will be of particular interest to clinicians interested in thoracic neoplasms to better understand and treat them Myelodysplastic Syndromes & Secondary Acute Myelogenous Leukemia Azra Raza, Suneel D. Mundle, 2012-12-06 Myelodysplastic syndromes are to the bone marrow what pneumonia is to the lungs the response of an organ to a variety of etiologic insults like aging toxic exposure infections and auto immunity Among infectious causes alone pneumonia could be the result of a variety of possible pathogens including bacterial viral tuberculous or fungal agents Similarly MDS cannot be treated as a single disease Attempts to harness the inherent complexity of MDS by devising classifications which group the various syndromes as one disease is as misguided as saying that a pneumonia is not infectious because it did not respond to antibiotics Progress in the field will occur faster when we re analyze this premise Therefore until a clearer picture of the disease emerges it is best to treat each of the MDS syndromes as a separate entity Having no classification is better than a misleading one Cancer research has been notable for its periodic cycles of promise and hope followed by defeat and disappointments It is not that there is no solution but that the problem has not been identified precisely This book is our attempt to define the most crucial questions related to MDS that need to be addressed immediately through logic analysis and rigorous experimentation If the emerging problems appear daunting then instead of being overwhelmed by them we should follow the advice of the great 20th century thinker Antonio Gramsci pessimism of the intellect must be faced with the optimism of will **Atlas of Selective Sentinel Lymphadenectomy for Melanoma, Breast Cancer and Colon Cancer** Stanley P. L. Leong, 2006-04-18 Atlas of Selective Lymphadenectomy for Melanoma Breast Cancer and Colon Cancer emphasizes a multidisciplinary approach combining the experiences of a nuclear medicine physician surgeon and pathologist This is an

important reference also for researchers and clinicians who want to become familiar with sentinel lymph node mapping The underlying thesis in solid tumor biology is that metastasis in general starts in an orderly progression with lymphatic spread first to the sentinel lymph node SLN in the nearest lymph node basin Therefore the logical approach is to harvest that specific SLN for thorough analysis Signal Transduction in Cancer David A. Frank,2006-04-18 One of the most exciting areas of cancer research now is the development of agents which can target signal transduction pathways that are activated inappropriately in malignant cells The understanding of the molecular abnormalities which distinguish malignant cells from their normal counterparts has grown tremendously This volume summarizes the current research on the role that signal transduction pathways play in the pathogenesis of cancer and how this knowledge may be used to develop the next generation of more effective and less toxic anticancer agents Series Editor comments The biologic behavior of both normal and cancer cells is determined by critical signal transduction pathways This text provides a comprehensive review of the field Leading investigators discuss key molecules that may prove to be important diagnostic and or therapeutic targets Head and Neck Cancer Bruce Brockstein,Gregory Masters,2006-04-18 Exciting advances are occurring in the understanding of the molecular pathogenesis of squamous head and neck cancers Epidemiology staging and screening as well as premalignancy chemoprevention and the molecular biology of head and neck cancer lay the groundwork for the understanding of the clinical chapters that follow Controversial treatments will be compared to the standard management of patient care Therapy chapters are divided into stage or category specific resectable advanced unresectable advanced or metastatic problems allowing the reader to review the current standards and options for patient types or specific patients easily Considerations of supportive care late toxicities and quality of life often overlooked are reviewed in detail This is a comprehensive summary of the current state of the art research and treatment *HIV & HTLV-I Associated Malignancies* Joseph A. Sparano,2012-12-06 Infection with the human immunodeficiency virus HIV and human T cell lymphotropic virus type I HTLV I is known to be associated with an increased risk of neoplastic disorders especially Kaposi s sarcoma and aggressive B cell lymphoma for the former and T cell lymphoma for the latter The information obtained from the study of these infections has led to remarkable advances in our understanding of the immune system as well as the biology of human neoplasms The management of malignant diseases in such patients also poses substantial challenges to clinicians This book provides an overview of the epidemiology biology clinical features and clinical management of neoplasms occurring in such individuals It is an important resource for clinicians treating these diseases and for basic scientists who have an interest in this field *Advances in Breast Cancer Management, 2nd edition* William J. Gradishar,William C. Wood,2013-03-09 The optimal management of breast cancer patients relies on the expertise of a team of medical specialists including radiologists surgeons radiation therapists and medical oncologists Much of the progress in breast cancer management made over the last several years reflects the translation of observations made in the laboratory to the clinic Critically evaluating the impact of new treatment

approaches relies on a commitment to well designed clinical trials In this volume Advances in Breast Cancer Management a renowned group of breast cancer experts have been asked to provide their perspective on management issues that directly effect patients on a day to day basis Dr Melody Cobleigh discusses the consequences of estrogen deprivation and the ways of ameliorating secondary symptoms and the potential long term morbidity Drs Haigh and Giuliano review the sentinel lymph node biopsy technique including results from their extensive experience Dr Abram Recht places into perspective the potential benefit of post mastectomy radiotherapy and reviews recent trials that address this issue Dr Dennis Slamon takes from us from the laboratory to the clinic in explaining the development of Herceptin as a paradigm for therapy targeted to specific molecular characteristics of breast cancer tumor cells Drs Nieto Shpall Crump and Pritchard offer different perspectives on the future of high dose chemotherapy with stem cell transplantation as a treatment for breast cancer patients Drs

Clinically Relevant Resistance in Cancer Chemotherapy Borje Andersson,David Murray,2012-12-06 Over the last several decades the introduction of new chemotherapeutic drugs and drug combinations has resulted in increased long term remission rates in several important tumor types These include childhood leukemia adult leukemias and lymphomas as well as testicular and trophoblastic tumors The addition of high dose chemotherapy with growth factor and hemopoietic stem cell support has increased clinical remission rates even further For the majority of patients with some of the more common malignancies however palliation rather than cure is still the most realistic goal of chemotherapy for metastatic disease The failure of chemotherapy to cure metastatic cancer is commonly referred to among clinicians as drug resistance This phenomenon can however often be viewed as the survival of malignant cells that resulted from a failure to deliver an effective drug dose to the cellular target because of anyone of or combination of a multitude of individual factors Clinically this treatment failure is often viewed as the rapid occurrence of resistance at the single cell level However in experimental systems stable drug resistance is usually relatively slow to emerge
