

## Types of Soil

### Sandy

As the name suggests, sandy soil is mostly made up of sand. Because of the fine grains, water drains well through this soil, and it stays dry. This means any plants growing in this type of soil will need to be well watered. A fertilizer should also be used to add any nutrients that are easily swept away.

### Silt

Silt has medium-sized particles. It holds onto enough water to allow for good plant growth while avoiding enough to avoid waterlogging. The particles allow the soil to compress easily, making it difficult for the plant to root. On a garden scale, it tends to maintain enough nutrients to make it fertile, supporting crop growth.

### Loam

Loam soils are a mixture of sand, silt, and clay. This soil holds on to most of its nutrients and keeps enough water to help plants get what they need. It also drains well to avoid waterlogging. This makes loam soil perfect for growing crops all year round.

### Chalk

Chalk-based soils contain a lot of calcium carbonate (chalk). It can be challenging to grow some plants in these types of soils since many plants prefer to grow in more acidic conditions. Water drains quickly through chalk soil, so plants cannot get enough moisture.

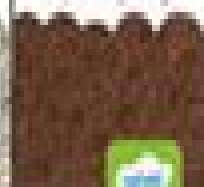

### Clay

The texture of all to work with, clay-based soils are known for being cloddy due to their ability to hold onto water. This means they can become waterlogged and muddy easily, which can be difficult for gardening. On the upside, clay soils also hold on well to nutrients, so fewer artificial fertilizers are needed to support crop growth.

### Peat

When moss, shrubs, and grasses die, they form peat. For a generally, forested area keeps soil moist. There is a fine layer of peat sitting along, leaving the water that's left extremely high in nutrients. Gardeners often choose to buy peat soil and mix it in their existing soil to improve its fertility.
