combination of special properties Many efforts have been made in the last two decades using novel nanotechnology and nanoscience knowledge in order to get nanomaterials with determined functionality This book focuses on polymer nanocomposites and their possible divergent applications There has been enormous interest in the commercialization of nanocomposites for a variety of applications and a number of these applications can already be found in industry This book comprehensively deals with the divergent applications of nanocomposites comprising of 22 chapters

Quantum-Mechanical Signal Processing and Spectral Analysis Dzevad Belkic, 2019-08-22 Quantum Mechanical Signal Processing and Spectral Analysis describes the novel application of quantum mechanical methods to signal processing across a range of interdisciplinary research fields Conventionally signal processing is viewed as an engineering discipline with its own specific scope methods concerns and priorities not usually encompassing quantum mechanics However the dynamics of systems that generate time signals can be successfully described by the general principles and methods of quantum physics especially within the Schroedinger framework Most time signals that are measured experimentally are mathematically equivalent to quantum mechanical auto correlation functions built from the evolution operator and wavefunctions This fact allows us to apply the rich conceptual strategies and mathematical apparatus of quantum mechanics to signal processing Among the leading quantum mechanical signal processing methods this book emphasizes the role of Pade approximant and the Lanczos algorithm highlighting the major benefits of their combination These two methods are carefully incorporated within a unified framework of scattering and spectroscopy developing an algorithmic power that can be exported to other disciplines The novelty of the author's approach to key signal processing problems the harmonic inversion and the moment problem is in establishing the Pade approximant and Lanczos algorithm as entirely algebraic spectral estimators This is of paramount theoretical and practical importance as now spectral analysis can be carried out from closed analytical expressions This overrides the notorious mathematical ill conditioning problems with round off errors that plague inverse reconstructions in those fields that rely upon signal processing Quantum Mechanical Signal Processing and Spectral Analysis will be an invaluable resource for researchers involved in signal processing across a wide range of disciplines
