

Using gene therapy to make new skin

To treat a boy with a genetic skin disease, doctors took a small sample of his skin. In the lab, they added a normal version of the boy's bad gene that causes the disease. The cells were grown into sheets of skin used to replace the boy's skin in three operations

Skin Tissue Models Alexandra P. Marques, Rui L. Reis, Rogério P. Pirraco, Mariana Cerqueira, 2017-11-14 Skin Tissue Models provides a translational link for biomedical researchers on the interdisciplinary approaches to skin regeneration As the skin is the largest organ in the body engineered substitutes have critical medical application to patients with disease and injury from burn wounds and surgical scars to vitiligo psoriasis and even plastic surgery This volume offers readers preliminary description of the normal structure and function of mammalian skin exposure to clinical problems and disease coverage of potential therapeutic molecules and testing skin substitutes models as study platforms of skin biology and emerging technologies The editors have created a table of contents which frames the relevance of skin tissue models for researchers as platforms to study skin biology and therapeutic approaches for different skin diseases for clinicians as tissue substitutes and for cosmetic and pharmaceutical industries as alternative test substrates that can replace animal models Offers descriptions of the normal structure function of mammalian skin exposure to clinical problems and more Presents coverage of skin diseases cancer genodermatoses vitiligo and psoriasis that extends to clinical requirements and skin diseases in vitro models Addresses legal requirements and ethical concerns in drugs and cosmetics in vitro testing Edited and authored by internationally renowned group of researchers presenting the broadest coverage possible

Cell Adhesion and Migration in Skin Disease Jonathan Barker, John McGrath, 2003-09-02 The past few years have seen considerable advances in our understanding of the molecular basis underlying cutaneous cell adhesion mechanisms Co authored by a number of leading experts in the field Cell Adhesion and Migration in Skin Disease provides a comprehensive overview of the critical role played by cell adhesion in determining the structure and function of both healthy and diseased human skin The book is divided into three main sections with each one addressing a principal function of adhesion molecules The first part focuses on the epidermis which as the skin's outermost layer acts as the human body's primary barrier of defence Roles played by cytoskeletal intermediate filaments and junctional complexes in cutaneous cell adhesion are emphasised with descriptions of blistering skin diseases that can arise if these molecules malfunction The second part describes the macromolecular interactions responsible for the anchorage of cells to the underlying extracellular basement membrane The experimental approaches detailed in the text not only reveal how the molecular components of the dermal epidermal junction have been elucidated but also highlight how mutations in the genes which encode these molecules are responsible for many heritable skin diseases Leukocytes continually infiltrate the skin and patrol it for potentially harmful pathogens Control of leukocyte adhesion to resident cells within the skin and to the extracellular matrix plays a key role in controlling these processes These mechanisms constitute the primary focus of the final section The pivotal role of leukocytes is examined in conjunction with the chronic inflammatory diseases which arise when components of the skin's finely tuned defence strategy go awry and the potential for these anomalies to be pinpointed

Skin Tissue Engineering and Regenerative Medicine

Mohammad Albanna, James H Holmes IV, 2016-01-14 The skin is the largest human organ system. Loss of skin integrity due to injury or illness results in a substantial physiologic imbalance and ultimately in severe disability or death. From burn victims to surgical scars and plastic surgery, the therapies resulting from skin tissue engineering and regenerative medicine are important to a broad spectrum of patients. Skin Tissue Engineering and Regenerative Medicine provides a translational link for biomedical researchers across fields to understand the interdisciplinary approaches which expanded available therapies for patients and additional research collaboration. This work expands on the primary literature on the state of the art of cell therapies and biomaterials to review the most widely used surgical therapies for the specific clinical scenarios. Explores cellular and molecular processes of wound healing, scar formation, and dermal repair. Includes examples of animal models for wound healing and translation to the clinical world. Presents the current state of and clinical opportunities for extracellular matrices, natural biomaterials, synthetic biomaterials, biologic skin substitutes, and adult and fetal stem and skin cells for skin regenerative therapies and wound management. Discusses new innovative approaches for wound healing, including skin bioprinting and directed cellular therapies.

Dermatologic, Cosmeceutic, and Cosmetic Development

Kenneth A. Walters, Michael S. Roberts, 2007-12-13 Recent advances in our understanding of the development and morphology of normal skin have led to improved methods to deliver therapeutic compounds to targeted areas both within the skin and systemically. This reference provides a clear overview of pharmaceutical and cosmetic practices, drugs, and therapies to manage and treat major and minor skin disorders. It examines the efficiency and delivery of topical therapies and explains how percutaneous absorption is affected by age, skin site, race, skin disease, and damage, and product form. Particular emphasis is on novel treatment approaches for major skin diseases and injuries pertaining to wounds and burns.
