

Soft X-ray Projection Lithography

N. M. Ceglio

Advanced X-ray Optics program
Lawrence Livermore National Laboratory

We envision a modular, soft x-ray projection lithography system exposing high-density integrated circuits (minimum feature size $\leq 1 \mu\text{m}$) at competitive production rates (~one 6" wafer/minute) before the end of this decade. The system is driven by a small-scale, high (average) power laser which generates x-rays from a laser-produced plasma, Figure 1. A narrow spectral band of l-rays in a ring-field illumination pattern onto an x-ray reflection mask. The reflection mask is simply a thin, metallized, integrated circuit (IC) pattern atop a multilayer-coated, highly polished, flat silicon substrate. The x-rays reflected from the mask are collected by a set of high-precision, Multilayer-coated wafers. The exposure at the wafer is in a ring-field pattern, and the entire IC pattern is replicated by synchronously scanning the mask and wafer, i.e., a step-and-scan exposure.
