was seven years in the making and details an easy 9 step by step process in learning how to discover earth's true surface shape using the sun. The information also details the required equipment to set up an orienting station to measure the sun's height accurately. Corey explains the process and application of geometry as a major part of the entire process as well as how to do the easy calculation steps required. Included are task list of individual tasks explained in detail for learning each step of the process included photos and digrams.

An overview of the sensors used to collect remote sensing data and important Earth observation missions is provided in chapter 2. The processing of satellite digital data, geometric and radiometric corrections, feature reduction, digital data fusion, image enhancements and analysis is dealt with in Chapter 3. In the chapter to follow, the interpretation of remote sensing data, a very important and crucial step in deriving information on natural resources including soils, is discussed. An introduction to soils as a natural body with respect to their formation, physical and chemical properties used during inventory of soils and soil classification is given in Chapter 5. The spectral response patterns of soils including hyperspectral characteristics fundamental to deriving information on soils from spectral measurements and the techniques of soil resources mapping are discussed in chapter 6 and 7 respectively. Furthermore, the creation of digital soil resources database and the development of soil information systems, a very important aspect of storage and dissemination of digital soil data to the end users, are discussed in chapter 8. Lastly, the applications of remote sensing techniques in soil moisture estimation and soil fertility evaluation are covered in chapter 9 and 10 respectively.
