Tenreiro Machado,Béla Pátkai,Imre J. Rudas,2008-12-18 Engineering practice often has to deal with complex systems of multiple variable and multiple parameter models almost always with strong non linear coupling The conventional analytical techniques based approaches for describing and predicting the behaviour of such systems in many cases are doomed to failure from the outset even in the

phase of the construction of a more or less appropriate mathematical model. These approaches normally are too categorical in the sense that in the name of modelling accuracy they try to describe all the structural details of the real physical system to be modelled. This can significantly increase the intricacy of the model and may result in a enormous computational burden without achieving considerable improvement of the solution. The best paradigm exemplifying this situation may be the classic perturbation theory: the less significant the achievable correction, the more work has to be invested to obtain it. A further important component of machine intelligence is a kind of structural uniformity giving room and possibility to model arbitrary particular details a priori not specified and unknown. This idea is similar to the ready to wear industry which introduced products which can be slightly modified later on in contrast to tailor made creations aiming at maximum accuracy from the beginning. These subsequent corrections can be carried out by machines automatically. This learning ability is a key element of machine intelligence. The past decade confirmed that the view of typical components of the present soft computing as fuzzy logic, neural computing, evolutionary computation and probabilistic reasoning are of complementary nature and that the best results can be applied by their combined application. Today the two complementary branches of Machine Intelligence that is Artificial Intelligence and Computational Intelligence serve as the basis of Intelligent Engineering Systems. The huge number of scientific results published in Journal and conference proceedings worldwide substantiates this statement. The present book contains several articles taking different viewpoints in the field of intelligent systems. *Agile Processes, in Software Engineering, and Extreme Programming* Helen Sharp, Tracy Hall, 2016-05-14. This book contains the refereed proceedings of the 17th International Conference on Agile Software Development XP 2016 held in Edinburgh UK in May 2016. While agile development has already become mainstream in industry, this field is still constantly evolving and continues to spur an enormous interest both in industry and academia. To this end the XP conference attracts a large number of software practitioners and researchers providing a rare opportunity for interaction between the two communities. The 14 full papers accepted for XP 2016 were selected from 42 submissions. Additionally 11 experience reports from 25 submissions, 5 empirical studies out of 12 submitted and 5 doctoral papers from 6 papers submitted were selected and in each case the authors were shepherded by an experienced researcher. Generally all of the submitted papers went through a rigorous peer review process.

Human-Centered Software Engineering Ahmed Seffah, Jean Vanderdonckt, Michel C. Desmarais, 2009-06-19
Activity theory is a way of describing and characterizing the structure of human activity of all kinds
First introduced by Russian psychologists Rubinshtein Leontiev and Vigotsky in the early part of the last century, activity theory has more recently gained increasing attention among interaction designers and others in the human computer interaction and usability communities
See for example Gay and H Brooke 2004
Interest was given a significant boost when Donald Norman suggested activity theory and activity centered design as antidotes to some of the putative ills of human centered design
Norman 2005
Norman, who has been credited with coining the phrase user centered design, suggested that too much attention focused on human users may be harmful
That to design better tools, designers need to focus not so much on users as on the activities in which users are engaged and the tasks they seek to perform within those activities
Although many researchers and practitioners claim to have used or been influenced by activity theory in their work, see for example Nardi 1996, it is often difficult to trace precisely where or how the results have actually been shaped by activity theory
In many cases, even detailed case studies report results that seem only distantly related, if at all, to the use of activity theory
Contributing to the lack of precise and traceable impact is that activity theory, spite its name, is not truly a formal and
