SOIL HORIZONS

Soil is made of many layers. These layers are called horizons.

Organic material (or humus) is decaying plant and animal remains.

Topsoil is made of humus (dark, organic material) and minerals. Plants and organisms like to live here.

Subsoil is made of clay, iron, and organic matter.

Parent material is made of mostly large rocks. These rocks break down into the soil in the upper layers.

Bedrock is made of a solid mass of rock.

Agricultural Soil Environment Suleiman Usman, 2013-02-06 Research Paper undergraduate from the year 2013 in the subject Geography Earth Science Geology Mineralogy Soil Science grade B University of Greenwich language English abstract It is believed that a better understanding of agricultural soil environment is a key to better soil quality and high crop yield Understanding the soil problems would certainly lead to solutions on how to tackle them However this could not only serve as a part of soil management but also as a part of economic development For instance when mother is healthy and fertile there is more expectation from her to provide healthy and quality produce but when there is deficiency in any of the elements either macros or micros elements her produce may also be affected hence increasing poverty and hunger High quality and fertile soil always provide better condition for the growth and development of plants right from seed germination up to the maturity stage Example deficiency in N P and K in soil might lead to several problems to growing plant in a particular soil environment These problems may include poor germination stunting and defoliations of plants late maturity and also susceptible to both pest and disease attack leading to poor yield of the crops Therefore understanding soil environment is a key to high yield of crop production in the north west one of northern Nigeria
