*Möbius Inversion in Physics* Nanxian Chen, 2010 This book attempts to bridge the gap between the principles of pure mathematics and the applications in physical science After the Möbius inversion formula had been considered as purely academic or beyond what was useful in the physics community for more than 150 years the apparently obscure result in classical mathematics suddenly appears to be connected to a variety of important inverse problems in physical science This book only requires readers to have some background in elementary calculus and general physics and prerequisite knowledge of number theory is not needed It will be attractive to our multidisciplinary readers interested in the Möbius technique which is a tiny but important part of the number theoretic methods It will inspire many students and researchers in both physics and mathematics In a practical problem continuity and discreteness are often correlated and few textbook have given attention to this wide and important field as this book Clearly this book will be an essential supplement for many existing courses such as mathematical physics elementary number theory and discrete mathematics

*Focused Ion Beam Systems* Nan Yao, 2007-09-13 The focused ion beam FIB system is an important tool for understanding and manipulating the structure of materials at the nanoscale Combining this system with an electron beam creates a DualBeam a single system that can function as an imaging analytical and sample modification tool Presenting the principles capabilities challenges and applications of the FIB technique this edited volume first published in 2007 comprehensively covers the ion beam technology including the DualBeam The basic principles of ion beam and two beam systems their interaction with materials etching and deposition are all covered as well as in situ materials characterization sample preparation three dimensional reconstruction and applications in biomaterials and nanotechnology

With nanostructured materials becoming increasingly important in micromechanical electronic and magnetic devices this self contained review of the range of ion beam methods their advantages and when best to implement them is a valuable resource for researchers in materials science electrical engineering and nanotechnology *Terahertz Sensing Technology - Vol 2: Emerging Scientific Applications And Novel Device Concepts* Michael S Shur,Dwight L Woolard,William R Loerop,2004-02-06 The last research frontier in high frequency electronics lies in the so called terahertz or submillimeter wave regime between the traditional microwave and the infrared domains Significant scientific and technical challenges within the terahertz THz frequency regime have recently motivated an array of new research activities During the last few years major research programs have emerged that are focused on advancing the state of the art in THz frequency electronic technology and on investigating novel applications of THz frequency sensing This book provides a detailed review of the new THz frequency technological developments that are emerging across a wide spectrum of sensing and technology areas Volume II presents cutting edge results in two primary areas 1 research that is attempting to establish THz frequency sensing as a new characterization tool for chemical biological and semiconductor materials and 2 theoretical and experimental efforts to define new device concepts within the THz gap Wide-band-gap Semiconductors C.G. Van de Walle,2012-12-02 Wide band gap semiconductors have been a research topic for many decades However it is only in recent years that the promise for technological applications came to be realized simultaneously an upsurge of experimental and theoretical activity in the field has been witnessed Semiconductors with wide band gaps exhibit unique electronic and optical properties Their low intrinsic carrier concentrations and high breakdown voltage allow high temperature and high power applications diamond SiC etc The short wavelength of band to band transitions allows emission in the green blue or even UV region of the spectrum ZnSe GaN etc In addition many of these materials have favorable mechanical and thermal characteristics These proceedings reflect the exciting progress made in this field Successful p type doping of ZnSe has recently led to the fabrication of blue green injection lasers in ZnSe applications of short wavelength light emitting devices range from color displays to optical storage In SiC advances in growth techniques for bulk as well as epitaxial material have made the commercial production of high temperature and high frequency devices possible For GaN refinement of growth procedures and new ways of obtaining doped material have resulted in blue light emitting diodes and opened the road to the development of laser diodes Finally while the quality of artificial diamond is not yet high enough for electronic applications the promise it holds in terms of unique material properties is encouraging intense activity in the field This volume contains contributions from recognized experts presently working on different material systems in the field The papers cover the theoretical experimental and application oriented aspects of this exciting topic Towards the First Silicon Laser Lorenzo Pavesi,Sergey Gaponenko,Luca Dal Negro,2012-12-06 Silicon the leading material in microelectronics during the last four decades also promises to be the key material in the future Despite many claims that silicon technology has reached fundamental limits the performance of

silicon microelectronics continues to improve steadily The same holds for almost all the applications for which Si was considered to be unsuitable The main exception to this positive trend is the silicon laser which has not been demonstrated to date The main reason for this comes from a fundamental limitation related to the indirect nature of the Si band gap In the recent past many different approaches have been taken to achieve this goal dislocated silicon extremely pure silicon silicon nanocrystals porous silicon Er doped Si Ge SiGe alloys and multiquantum wells SiGe quantum dots SiGe quantum cascade structures shallow impurity centers in silicon and Er doped silicon All of these are abundantly illustrated in the present book
