

You're either too  
enjoying the beach  
on New Year's Eve  
or looking forward  
the day praying that  
computer failures  
don't occur at the  
stroke of midnight.  
Unless attitudes  
change, chances  
are there will be  
a monumental  
computer failure.

# S O L V I N G THE YEAR 2000 P R O B L E M

When midnight arrives, computers around the world will change their system dates. January 1, 2000 will be the date—or will it? Will the date change from 99-12-31 to 01-01-00? Whichever! What happened to the century digit in the date?

Most programmers and virtually all hardware manufacturers were thoughtless not to foresee the disaster that lurks at the turn of the century. There is a very strong possibility that this bug is in any program that uses a year in a calculation. That is, the millions of lines of instructions running daily on hundreds of millions of computers—both large and small—could come to a screeching halt, or worse, generate inaccurate data that is hard to uncover.

We're talking about programs that run financial institutions, insurance companies, the world economy, and in particular, the Social Security Administration, the U.S. Treasury, NASA, the FAA, and the Defense Department. All of them could crash at the turn of the century. That's right—the economy of every country can be affected by the year 2000 bug.

Fixing the problem is far from simple. The solution involves a sizable commitment that needs immediate attention. *Solving the Year 2000 Problem* explores this never-before-seen problem in great detail and explains the inside ways to stamp out the bug before the bug stamps out your programs.
