Strategy In Head Injury Management:

A Practical Guide to Head Injury Rehabilitation Michael D. Wesolowski, Arnie H. Zencius, 2013-06-29 Behavioral neuropsychology presents at once a challenge and an opportunity for the field of behavior analysis. A great diversity of problem areas including education, classroom management, child rearing, retardation, and industry have been treated effectively by the behavior analytic approach which has traditionally and quite deliberately chosen to deemphasize physiology and cognitive variables. Yet brain injury by its nature entails neurological insult that is often closely related to specific cognitive dysfunctions. The challenge for behavior analysis is to develop effective treatments for a disorder with such clearly defined tripartite characteristics. The opportunity exists for behavior analysis to expand its conceptual basis as well as to provide benefits to patients otherwise despairing of assistance. Case histories demonstrate over 20 years of successful applications of behavior analysis to brain injured individuals indicating that some applications are possible but are these reports notable exceptions or the harbingers of a new general therapeutic approach? The present book describes an overall focused behavioral program for dealing with the diversity of brain injury problems in a general brain injury rehabilitation setting. The authors describe what types of neurological damage are associated with specific types of cognitive, emotional dysfunction and in turn with specific types of behavioral dysfunction thereby demonstrating how the choice of behavioral treatment is guided by the neurological and subjective assessment. The result is a conceptually unified approach. The distinctive value of this book lies in the detail as well as the programmatic guidelines for actual implementation of this behavioral approach.

SNYDER Receptor Research Reaches Neurology Relevance to Neurodegenerative Diseases and Stroke President George Bush has heralded the 1990s as the decade of the brain based largely on the rapid escalation of advances in the molecular neuro sciences and the likelihood that these will bear therapeutic fruit before the turn of the century There is little doubt that the 1970s and 1980s have witnessed more remarkable advances in the molecular neurosciences than all of the preceding hundred years Identification of receptor sites for drugs and neurotransmitters along with simple sensitive and specific means of monitoring them has made it possible to elucidate the mechanism of action for many known drugs and to identify new chemical entities as potential therapeutic agents At the same time the numbers of distinct neurotransmitters have multiplied Prior to 1970 only the biogenic amines were well accepted as transmitters The early 1970s witnessed the gradual acceptance of amino acids as major excitatory and inhibitory neurotransmitters Identification of opiate receptors and the subsequent identification of the enkephalins as their endogenous ligands led to an appreciation of peptides as putative transmitters and the accumulation of as many as a hundred neuropeptides by the decade s end In the 1980s the revolutions of molecular biology have been applied aggressively to the neurosciences with molecular cloning for neuropeptide precursors many important neurochemical enzymes and receptors for numerous transmitters

Hayes,András Büki, Frank C Tortella, Kevin K W Wang,2015-02-25 Traumatic brain injury TBI is a major cause of death and disability and one of the greatest unmet needs in medicine and public health TBI not only has devastating effects on patients and their relatives but results in huge direct and indirect costs to society Although guidelines for the management of patients have been developed and more than 200 clinical trials have been conducted they have resulted in few improvements in clinical outcomes and no effective therapies approved for TBI It is now apparent that the heterogeneity of clinical TBI is

underlain by molecular phenotypes more complex and interactive than initially conceived and current approaches to the characterization management and outcome prediction of TBI are antiquated unidimensional and inadequate to capture the interindividual pathophysiological heterogeneity Recent advances in proteomics and biomarker development provide unparalleled opportunities for unraveling substantial injury specific and patient specific variability and refining disease characterization The identification of novel sensitive objective tools referred to as biomarkers can revolutionize pathophysiological insights enable targeted therapies and personalized approaches to clinical management In this Research Topic we present novel approaches that provide an infrastructure for discovery and validation of new biomarkers of acute brain injury These techniques include refined mass spectrometry technology and high throughput immunoblot techniques Output from these approaches can identify potential candidate biomarkers employing systems biology and data mining methods In this Research Topic we present novel approaches that provide an infrastructure for discovery and validation of new biomarkers of acute brain injury These techniques include refined mass spectrometry technology and high throughput immunoblot techniques Output from these approaches can identify potential candidate biomarkers employing systems biology and data mining methods Finally suggestions are provided for the way forward with an emphasis on need for a multidimensional approach that integrate a panel of pathobiologically diverse biomarkers with clinical variables and imaging based assessments to improve diagnosis and classification of TBI and to develop best clinical practice guidelines Mild Traumatic Brain Injury Rehabilitation Toolkit Margaret M.
