## **Stress Doppler Echocardiography:**

Stress Doppler Echocardiography Steve M. Teague, 2012-12-06 For almost 40 years a small but intense group of cardiovascular investigators have evaluated cardiac performance by measuring the mass velocity and acceleration of blood ejected from the left ventricle. These studies reveal that energy is transferred from ventricle to blood very early in systole and that the left ventricle is characterized as an impulse generator. Recent explosive developments in Doppler echocardiography have allowed study of the energetics of ventricular contraction through noninvasive acceleration velocity and volumetric flow measurements. Compared against reference standards of ejection fraction  $dP/dt$  and instantaneous pressure gradient across the aortic valve, Doppler acceleration and velocity measurements are highly sensitive to changes in ventricular performance. Most patients seeking cardiovascular care present with coronary artery disease as a chief concern. This book focuses upon identification of coronary disease presence and severity through the evaluation of left ventricular Doppler ejection responses to stress loading. Chapters I through 4 detail basic research on the dynamics of left ventricular ejection in ischemic and nonischemic animal models. Chapters 5 through 13 present clinical correlates of changes in the Doppler systolic ejection pulse during exercise and under pharmacologic stress loading. Angiographic anatomy, thallium perfusion defects, and radionuclear ejection fraction responses serve as reference standards. Chapters 14, 15, and 16 address applications of Doppler echocardiography during the stresses of brief coronary occlusion, myocardial infarction, and post infarction recovery, while chapters 17 and 20 illustrate applications of stress Doppler techniques in valvular heart disease. **The Practice of**

Gaine, Robert Naeije, Andrew John Peacock, 2014-05-12 The heart and lung are intricately linked When the heart is affected by disease the lungs will often show some related pathological or clinical conditions and vice versa Pulmonary heart disease is by definition a condition when the lungs cause the heart to fail The left ventricle in combination with the other structures in the left heart pumps blood throughout the body The right ventricle and structures of the right heart pumps blood to the lungs where it is oxygenated and returned to the left heart for distribution In normal circumstances the right heart pumps blood into the lungs without any resistance The lungs usually have minimal pressure and the right heart easily pumps blood through However when there is lung disease present like emphysema chronic obstructive lung disease COPD or pulmonary hypertension the small blood vessels become very stiff and rigid The right ventricle is no longer able to push blood into the lungs and eventually fails This is known as pulmonary heart disease Pulmonary heart disease is also known as right heart failure or cor pulmonale The chief cause of right heart failure is the increase in blood pressure in the lungs pulmonary artery
