Islamic Science: Knowledge in Motion Muzaffar Iqbal, 2017-05-15 Situated between the Greek Indian and Persian scientific traditions and modern science the Islamic scientific tradition received enriched transformed and then bequeathed scientific knowledge to Europe The articles selected for this volume explore the fascinating process of knowledge in motion between different civilizations *The Mathematics of the Heavens and the Earth* Glen Van Brummelen, 2021-08-10 The Mathematics of the Heavens and the Earth is the first major history in English of the origins and early development of trigonometry Glen Van Brummelen identifies the earliest known trigonometric precursors in ancient Egypt Babylon and Greece and he examines the revolutionary discoveries of Hipparchus the Greek astronomer believed to have been the first to make systematic use of trigonometry in the second century BC while studying the motions of the stars The book traces

trigonometry's development into a full fledged mathematical discipline in India and Islam explores its applications to such areas as geography and seafaring navigation in the European Middle Ages and Renaissance and shows how trigonometry retained its ancient roots at the same time that it became an important part of the foundation of modern mathematics. The Mathematics of the Heavens and the Earth looks at the controversies as well including disputes over whether Hipparchus was indeed the father of trigonometry whether Indian trigonometry is original or derived from the Greeks and the extent to which Western science is indebted to Islamic trigonometry and astronomy. The book also features extended excerpts of translations of original texts and detailed yet accessible explanations of the mathematics in them. No other book on trigonometry offers the historical breadth, analytical depth and coverage of non Western mathematics that readers will find in The Mathematics of the Heavens and the Earth.

Islamic Science and the Making of the European Renaissance

George Saliba, 2011-01-21. The rise and fall of the Islamic scientific tradition and the relationship of Islamic science to European science during the Renaissance. The Islamic scientific tradition has been described many times in accounts of Islamic civilization and general histories of science with most authors tracing its beginnings to the appropriation of ideas from other ancient civilizations, the Greeks in particular. In this thought provoking and original book, George Saliba argues that contrary to the generally accepted view, the foundations of Islamic scientific thought were laid well before Greek sources were formally translated into Arabic in the ninth century. Drawing on an account by the tenth century intellectual historian Ibn al Naidm that is ignored by most modern scholars, Saliba suggests that early translations from mainly Persian and Greek sources outlining elementary scientific ideas for the use of government departments were the impetus for the development of the Islamic scientific tradition. He argues further that there was an organic relationship between the Islamic scientific thought that developed in the later centuries and the science that came into being in Europe during the Renaissance. Saliba outlines the conventional accounts of Islamic science, then discusses their shortcomings and proposes an alternate narrative. Using astronomy as a template for tracing the progress of science in Islamic civilization, Saliba demonstrates the originality of Islamic scientific thought. He details the innovations including new mathematical tools made by the Islamic astronomers from the thirteenth to sixteenth centuries and offers evidence that Copernicus could have known of and drawn on their work. Rather than viewing the rise and fall of Islamic science from the often narrated perspectives of politics and religion, Saliba focuses on the scientific production itself and the complex social, economic and intellectual conditions that made it possible.
