

Social and Emotional Development in Infancy

We begin by placing infancy in context. We consider the psychobiological context of temperamental individuality and neurobiological growth that shape early emotions, individuality, and patterns of relating to others. We also consider the contexts of culture and family that shape, and are shaped by, early experiences. In doing so, the dynamic interplay of nature and nurture is profiled at the outset of the chapter (see, too, chapter by Overton in this volume).

Early emotional development and the growth of sociability are profiled next, with special attention to the importance of emotion to early social interaction and social relationships. This intertwining illustrates the integration of developmental functions, structures, and processes in infancy. In the section that follows, we focus on attachment relationships between infants and their caregivers, a topic of significant research interest during the past 30 years. Two central questions are highlighted: (a) how infants develop different patterns of attachment behavior in these relationships and (b) the controversial question of potentially enduring consequences of variations in attachments during infancy. The importance of relationships for self-awareness, emotional understanding, empathy, and conscience is subsequently discussed with respect to the early representations that are influenced by relational experience. Our focus on the representational features of early relationships constitutes a bridge between infancy and psychosocial development in early childhood, when representations of self, others, and relationships truly flourish. Finally, in a concluding note we consider the implications of research and theory in this field for policy and practice.
