Tamer Ozsu, 2022-06-01 Many applications process high volumes of streaming data among them Internet traffic analysis financial tickers and transaction log mining In general a data stream is an unbounded data set that is produced incrementally over time rather than being available in full before its processing begins In this lecture we give an overview of recent research in stream processing ranging from answering simple queries on high speed streams to loading real time data feeds into a streaming warehouse for off line analysis We will discuss two types of systems for end to end stream processing Data Stream Management Systems DSMSs and Streaming Data Warehouses SDWs A traditional database management system typically processes a stream of ad hoc queries over relatively static data In contrast a DSMS evaluates static long running queries on streaming data making a single pass over the data and using limited working memory In the first part of this lecture we will discuss research problems in DSMSs such as continuous query languages non blocking query operators that continually react to new data and continuous query optimization The second part covers SDWs which combine the real time response of a DSMS by loading new data as soon as they arrive with a data warehouse s ability to manage Terabytes of historical data on secondary storage Table of Contents Introduction Data Stream Management Systems Streaming Data Warehouses Conclusions [A Modern Guide to the Multiple Streams Framework](#) Nikolaos Zahariadis, Nicole Herweg, Reimut Zohlnhöfer, Evangelia Petridou, 2023-11-03 Applying the Multiple Streams Framework MSF to a global range of case studies this pioneering Modern Guide addresses how policymakers decide what issues to attend to and which choices to make or implement In doing so it outlines that far from being the exception ambiguity and timing are integral parts of every comparative explanation of the policy process [Streaming Audio](#) Jon Luini, Jon R.
