The development of a new tool analytic device or approach frequently facilitates rapid growth in scientific understanding although the process is seldom linear The study of heart rate variability HRV defined as the extent to which beat to beat variation in heart rate varies is a rapidly maturing paradigm that integrates health and wellness observations across a wide variety of biomedical and psychosocial phenomena and illustrates this nonlinear path of development The utility of HRV as an analytic and interventive technique goes far beyond its original application as a robust predictor of sudden cardiac death This Research Topic aims to provide a conceptual framework to use in exploring the utility of HRV as a robust parameter of health status using a broad and inclusive definition of health and well being From the broadest perspective current biomedical science emerged from shamanistic and religious healing practices and empirically observed interventions made as humans emerged from other hominins The exponential growth of physics chemistry and biology provided scientific support for the model emphasizing pathology and disorders Even before the momentous discovery of germ theory sanitation and other preventive strategies brought about great declines in mortality and morbidity The revolution that is currently expanding the biomedical model is an integrative approach that includes the wide variety of non physio chemical factors that contribute to health In the integrative approach health is understood to be more than the absence of disease and emphasis is placed on optimal overall functioning within the ecological niche occupied by the organism This approach also includes not just interventive techniques and procedures but also those social and cultural structures that provide access to safe and effective caring for sufferers Beyond the typical drug and surgical interventions which many identify with the Western biomedical model that currently enjoys an unstable hegemony such factors also include cognitive behavioral social and cultural practices such as have been shown to be major contributors to the prevention and treatment of disease and the promotion of health and optimal functioning This Integrative Model of Health and Well being also derives additional conceptual power by recognizing the role played by evolutionary processes in which conserved adaptive human traits and response tendencies are not congruent with current industrial and postindustrial global environmental demands and characteristics This mismatch contributes to an increasing incidence of chronic conditions related to lifestyle and health behavior Such a comprehensive model will make possible a truly personalized approach to health and well being including

and going far beyond the current emphasis on genomic analysis which has promised more than it has currently delivered HRV offers an inexpensive and easily obtained measure of neurovisceral functioning which has been found to relate to the occurrence and severity of numerous physical disease states as well as many cognitive behavioral health disorders This use of the term neurovisceral refers to the relationships between the nervous system and the viscera providing a more focused and specific conceptual alternative to the now nearly archaic mind body distinction This awareness has led to the recent and growing use of HRV as a health biomarker or health status measure of neurovisceral functioning It facilitates studying the complex two way interaction between the central nervous system and other key systems such as the cardiac gastroenterological pulmonary and immune systems The utility of HRV as a broad spectrum health indicator with possible application both clinically and to population health has only begun to be explored Interventions based on HRV have been demonstrated to be effective evidence based interventions with HRV biofeedback treatment for PTSD representing an empirically supported modality for this complex and highly visible affliction As an integral measure of stress HRV can be used to objectively assess the functioning of the central enteric and cardiac nervous systems all of which are largely mediated by the vagal nervous complex HRV has also been found to be a measure of central neurobiological concepts such as executive functioning and cognitive load The relatively simple and inexpensive acquisition of HRV data and its ease of network transmission and analysis make possible a promising digital epidemiology which can facilitate objective population health studies as well as web based clinical applications An intriguing example is the use of HRV data obtained at motor vehicle crash sites in decision support regarding life flight evacuations to improve triage to critical care facilities This Research Topic critically addresses the issues of appropriate scientific and analytic methods to capture the concept of the Integrative Health and Well being Model The true nature of this approach can be appreciated only by using both traditional linear quantitative statistics and nonlinear systems dynamics metrics which tend to be qualitative The Research Topic also provides support for further development of new and robust methods for evaluating the safety and effectiveness of interventions and practices going beyond the sometimes tepid and misleading gold standard randomized controlled clinical trial

Thomas Cunningham,2023-10-28 The cardiovascular system and the neuroendocrine system are integrated at multiple levels This integration is key to normal physiological function Further it adapts to accommodate changes related to aging the organism s

reproductive state or physiological challenges This type of adaptability or plasticity also can contribute to pathophysiology when these systems are stressed This volume discusses how neuroendocrine systems influence cardiovascular function in health and disease The first section provides detailed background information on neuronal and neuroendocrine control of cardiovascular function This is followed by chapters highlighting the cardiovascular role of neuroendocrine hormones in regulating physiological states such as pregnancy and the effects of biological sex on vascular function The influence of exercise stress psychology and aging on cardiovascular function and dysfunction and the possibility of therapeutically targeting the neuroendocrine axis for the treatment of cardiovascular disease are discussed in the final section of the book This book is of relevance for students trainees and established researchers alike who are seeking for an overview on the neuroendocrine control of cardiovascular function and disease This is the fourteenth volume in the International Neuroendocrine Federation INF Masterclass in Neuroendocrinology series which aims to illustrate the highest standards and encourage the use of the latest technologies in basic and clinical research and hopes to provide inspiration for further exploration into the exciting field of neuroendocrinology *National Union Catalog, 1981 ,1982* Can't Get You Out of My Head: Brain-Body Interactions in Perseverative Cognition Cristina Ottaviani, Julian F. Thayer, Bart Verkuil, Hugo D. Critchley, Jos F. Brosschot, 2018-02-16 Perseverative cognition is defined as the repetitive or sustained activation of cognitive representations of past stressful events or feared events in the future and even at non clinical levels it causes a fight or flight action tendency followed by a cascade of biological events starting in the brain and ending as peripheral stress responses In the past decade such persistent physiological activation has proven to impact individuals health potentially leading to somatic disease As such perseverative cognition has recently been proposed as the missing piece in the relationships between stress psychopathology and risk for health Perseverative cognition is indeed a hallmark of conditions such as anxiety and mood disorders that are at increased though still unexplained cardiovascular risk Although the pivotal role of ruminative and worrisome thoughts in determining the onset and maintenance of psychopathological disorders has been acknowledged for a long time its effects on the body via reciprocal influences between mental processes and the body s physiology have been neglected Moreover perseverative cognition is definitely not restricted to psychopathology it is extremely common and likely even omnipresent pervading daily life The objective of the Research Topic is to provide an interdisciplinary examination of cutting edge neuroscientific research on brain body signatures of perseverative cognition in both healthy and psychopathological individuals Despite the evident role of the brain in repetitive thinking and the assumption that our mind is embodied brain body pathways from perseverative cognition to health risk have remained largely unexplored *Index of Conference Proceedings Received* British Library.
