with no record of blowing snow. Since salination of loose snow normally begins at about 12 mph, an absence of blowing snow at 33 mph certifies presence of well-developed crust. This surface, labeled the June 18 surface, appears more distinctly in other pits.

The period from May 20 (or June 18) to the following late spring is stratigraphically uninteresting.

October 1957 was characterized, however, by

precipitating and blowing snow which fell on a long inactive September surface at 77 cm (either September 14 or 21). October and September surfaces occur close together and invariably mark the break in the density profile from winter massive to summer sublimated layers. From November 1 to 4 this October activity terminated. Effects of air temperature were aided by long-wave radiation from low solid cloud cover in early November, and surface melting and drizzle are recorded. A thick
