

An Integer Programming Model to Limit Hospital Selection in Studies with Repeated Sampling

Michael Shwartz, Ronald K. Klimberg, Melinda Karp, Lisa I. Iezzoni, Arlene S. Ash, Janelle Heineke, Susan M. C. Payne, and Joseph D. Restuccia

Objective. We describe an integer programming model that, for studies requiring repeated sampling from hospitals, can aid in selecting a limited set of hospitals from which medical records are reviewed.

Study Setting. The model is illustrated in the context of two studies: (1) an analysis of the relationship between variations in hospital admission rates across geographic areas and rates of inappropriate admissions; and (2) a validation of computerized algorithms that screen for complications of hospital care.

Study Design. Common characteristics of the two studies: (1) hospitals are classified into categories, e.g., high, medium, and low; (2) the classification process is repeated several times, e.g., for different medical conditions; (3) medical records are selected separately for each iteration of the classification; and (4) for budgetary and logistical reasons, reviews must be concentrated in a relatively small subset of hospitals.

Data Collection/Extraction Methods. In each study, hospitals are ranked based on analysis of hospital discharge abstract data.

Conclusion. The model is useful for identifying a subset of hospitals at which more intensive reviews will be conducted.

Key Words. Sampling, medical records, integer programming model, hospital admission rates

Health services research studies frequently involve the review of medical records at a number of hospitals. With increased emphasis on outcomes research, such studies are likely to become more common. Unless performed by organizations like peer review organizations (PROs) as part of legally mandated review activities, record reviews require hospital approval, which can be difficult and time-consuming to obtain. Further, if reviews are done at the hospital, the expense of sending reviewers to a large number of
