Special Computer Architectures For Pattern Processing:

Special Computer Architectures for Pattern Processing King-Sun Fu,2018-05-04 It has been recognized for a long time that a conventional sequential processor is inefficient for operations on pictorial data where relatively simple operations need to be performed on a large number of data elements pixels Though many parallel processing architectures for picture processing have been proposed in the past very few have actually been implemented due to the costs involved With LSI technology it is becoming possible to realize parallel architectures at a modest cost In the following the authors review some of the proposed architectures for pattern recognition and image processing **Special Computer Architectures for Pattern Processing** King-Sun Fu,2018-05-04 It has been recognized for a long time that a conventional sequential processor is inefficient for operations on pictorial data where relatively simple operations need to be performed on a large number of data elements pixels Though many parallel processing architectures for picture processing have been proposed in the past very few have actually been implemented due to the costs involved With LSI technology it is becoming possible to realize parallel architectures at a modest cost In the following the authors review some of the proposed architectures for pattern recognition and image processing **Computer Architectures for Spatially Distributed Data** Herbert Freeman,G.G. Pieroni,2013-11-09 These are the proceedings of a NATO Advanced Study Institute ASI held in Cetraro Italy during 6 17 June 1983 The title of the ASI was Computer Arehiteetures for SpatiaZZy vistributed Vata and it brouqht together some 60 participants from Europe and America Presented ere are 21 of the lectures that were delivered The articles cover a wide spectrum of topics related to computer architecture s specially oriented toward the fast processing of spatial data and represent an excellent review of the state of the art of this topic For more than 20 years now researchers in pattern recognition image processing meteorology remote sensing and computer engineering have been looking toward new forms of computer architectures to speed the processing of data from two and three dimensional processes The work can be said to have commenced with the landmark article by Steve Unger in 1958 and it received a strong forward push with the development of the ILIAC III and IV computers at the University of Illinois during the 1960 s One clear obstacle faced by the computer designers in those days was the limitation of the state of the art of hardware when the only switching devices available to them were discrete transistors As aresult parallel processing was generally considered to be imprae tieal and relatively little progress was made **VLSI for Pattern Recognition and Image Processing** K.S. Fu,2013-03-08 During the past two decades there has been a considerable growth in interest in problems of pattern recognition and image processing PRIP This inter est has created an increasing need for methods and techniques for the design of PRIP systems PRIP involves analysis classification and interpretation of data Practical applications of PRIP include character recognition re mote sensing analysis of medical signals and images fingerprint and face identification target recognition and speech understanding One difficulty in making PRIP systems practically feasible and hence more popularly used is the requirement

of computer time and storage This situation is particularly serious when the patterns to be analyzed are quite complex Thus it is of the utmost importance to investigate special comput er architectures and their implementations for PRIP Since the advent of VLSI technology it is possible to put thousands of components on one chip This reduces the cost of processors and increases the processing speed VLSI algorithms and their implementations have been recently developed for PRIP This book is intended to document the recent major progress in VLSI system design for PRIP applications **Fundamentals in Computer Vision** O. D. Faugeras,1983-07-28 Modern Cellular Automata Kendall Preston Jr.,Michael J.B. Duff,2013-06-29 It is with great pleasure that I present this fourth vol ume in the series Advanced Applications in Pattern Recognition It would be difficult to find two authors better versed in the design and application of parallel image processing systems due to both their own many years of pioneering in the field and their encyclopedic knowledge of what is going on in uni versity and industrial laboratories around the world The monograph is unique in its parallel presentation of orthogonal and hexagonal dissections and the wealth of graphic illustration of algorithmic procedures for processing and analyz ing images in the various known implementations of parallel im age processing architectures This volume should find a place on the bookshelf of every practitioner of pattern recognition image processing and compu ter graphics Morton Nadler General Editor vii PREFACE This book endeavors to introduce the reader to the subject of cellular logic and cellular automata and is devoted particu larly to those parts dealing with the manipulation of pictorial data The study of cellular automata owes much to the pioneer ing work of John von Neumann during the 1950s Von Neumann was interested in general problems in the behavior of computing structures and was immensely impressed by the complexity and performance of the human brain which he felt must point to wards successful designs for automatic computing machines **Morphological Image Processing: Architecture and VLSI design** P.P. Jonker,2012-12-06 Summary Based on the experiences of past designs and the outcome of recent studies in the comparisons of low level image processing architectures a pipelined system for real time low image processing has been designed and realized in CMOS technology To minimize design pitfalls a study was performed to the details of the design solutions that have been found in embodimentsof the three main architectural groups of image processing the Square Processor Arrays the Linear Processor Arrays and the Pipelines This is reflected in a theoretical model As the design is based on bitplane wise processing of images research was performed on the principles ofCellularLogic Processing of two dimensional images of binary A methodology has been developed that is based on the transformation images using sets of Hit or Miss masks This method appeared to be extendable to higher dimensional images A theoretical model for the generation of break point conditions in high dimensional images has been developed and applied up to dimension three **Handbook of Artificial Intelligence Applications for Industrial Sustainability** Vikas Garg,Richa Goel,Pooja Tiwari,Esra S.
