Specification And Verification Of Systolic Arrays:

Specification And Verification Of Systolic Arrays Magdy A Bayoumi, Nam Ling, 1999-08-05 Circuits and architectures have become more complex in terms of structure interconnection topology and data flow Design correctness has become increasingly significant as errors in design may result in strenuous debugging or even in the repetition of a costly manufacturing process Although circuit simulation has been used traditionally and widely as the technique for checking hardware and architectural designs it does not guarantee the conformity of designs to specifications Formal methods therefore become vital in guaranteeing the correctness of designs and have thus received a significant amount of attention in the CAD industry today This book presents a formal method for specifying and verifying the correctness of systolic array designs Such architectures are commonly found in the form of accelerators for digital signal image and video processing These arrays can be quite complicated in topology and data flow In the book a formalism called STA is defined for these kinds of dynamic environments with a survey of related techniques A framework for specification and verification is established Formal verification techniques to check the correctness of the systolic networks with respect to the algorithmic level specifications are explained The book also presents a Prolog based formal design verifier named VSTA developed to automate the verification process as using a general purpose theorem prover is usually extremely time consuming Several application examples are included in the book to illustrate how formal techniques and the verifier can be used to automate proofs

Algorithm Engineering for Integral and Dynamic Problems Lucia Rapanotti, 2001-01-23 Algorithm engineering allows computer engineers to produce a computational machine that will execute an algorithm as efficiently and cost effectively as possible given a set of constraints such as minimal performance or the availability of technology Addressing algorithm engineering in a parallel setting regular array syntheses offer powerful computation and embody best practice but often face the criticism that they are applicable only to restricted classes of algorithms Algorithm Engineering for Integral and Dynamic Problems reviews the basic principles of regular array synthesis and shows how to extend its use into classes of algorithms traditionally viewed to be beyond its domain of application The author discusses the transformation of the initial algorithm specification into a specification with data dependencies of increased regularity in order to obtain corresponding regular arrays by direct application of the standard mapping techniques The book includes a review of the basic principles of regular array synthesis followed by applications of these techniques to well known algorithms concluding with numerous case studies to illustrate the methods Researchers and practitioners in algorithm engineering will find that this text significantly extends their understanding of the applications of regular array synthesis and regular array processors beyond the traditionally narrow field of relevance

Architecture of High Performance Computers Volume II R. IBBETT,2013-11-11 *A Systolic Array Optimizing Compiler* Monica S. Lam,2012-12-06 This book is a revision of my Ph D thesis dissertation submitted to Carnegie Mellon University in 1987 It documents the research and results of the compiler technology developed for the Warp machine Warp is a systolic array built out of custom high performance processors each of which can execute up to 10 million floating point operations per second 10 MFLOPS Under the direction of H T Kung the Warp machine matured from an academic experimental prototype to a commercial product of General Electric The Warp machine demonstrated that the scalable architecture of high performance programmable systolic arrays represents a practical cost effective solution to the present and future computation intensive applications The success of Warp led to the follow on iWarp project a joint project with Intel to develop a single chip 20 MFLOPS processor The availability of the highly integrated iWarp processor will have a significant impact on parallel computing One of the major challenges in the development of Warp was to build an optimizing compiler for the machine First the processors in the xx A Systolic Array Optimizing Compiler array cooperate at a fine granularity of parallelism interaction between processors must be considered in the generation of code for individual processors Second the individual processors themselves derive their performance from a VLIW Very Long Instruction Word instruction set and a high degree of internal pipelining and parallelism The compiler contains optimizations pertaining to the array level of parallelism as well as optimizations for the individual VLIW processors

Logic and Algebra of Specification Friedrich L. Bauer, Wilfried Brauer, Helmut Schwichtenberg, 2012-12-06 For some years specification of software and hardware systems has been influenced not only by algebraic methods but also by new developments in logic These new developments in logic are partly based on the use of algorithmic techniques in deduction and proving methods but are also due to new theoretical advances to a great extent stimulated by computer science which have led to new types of logic and new logical calculi The new techniques methods and tools from logic combined with algebra based ones offer very powerful and useful tools for the computer scientist which may soon become practical for commercial use where in particular more powerful specification tools are needed for concurrent and distributed systems This volume contains papers based on lectures by leading researchers which were originally given at an international summer school held in Marktoberdorf in 1991 The papers aim to give a foundation for combining logic and algebra for the purposes of specification under the aspects of automated deduction proving techniques concurrency and logic abstract data types and operational semantics and constructive methods

The Marktoberdorf Summer Schools on Informatics were started in 1970 with the intention to convene every second or third year a group of top researchers in computing devoted to preach their most recent results to an elite of advanced students young and most promising people and prepared to stand their questions criticism and suggestions The themes of these Advanced Study Institutes under the sponsorship of the NATO Scientific Affairs Division varied slightly over the years oscillating more or less around Programming Methodology as the following list shows

1970 Data Structures and Computer Systems
1971 Program Structures and Fundamental Concepts of Programming
1973 Structured Programming and Programmed Structures
1975 Language Hierarchies and Interfaces
1978 Program Construction
1981 Theoretical Foundations of Programming Methodology
1984 Control Flow and Data Flow Concepts of Distributed Programming
1986 Logic of Programming and Calculi of Discrete Design
1988 Constructive Methods in Computing Science
1989 Logic Algebra and Computation

Logic Algebra and Computation is the theme of the summer school to which this volume is devoted It is the tenth in succession but it is also the first in a new series the blue series that is intended to alternate in future with the traditional the red series arrangement in fact the tenth summer school in the red series with the title Programming and Mathematical Method held in 1990 was the subject of celebrating both its serial number and the twenty years of Marktoberdorf Summer Schools altogether
