Cumulative Prospect Theory Michael Borß, 2017-03-02 There is broad theoretical and empirical evidence that investors exhibit a preference for skewness However there is little research regarding the extent to which individuals really favor positive skewness in individual decision making In this dissertation a controlled laboratory experiment is used to test for skewness preferences and prudence a broader third order risk preference that is closely linked to skewness preferences Skewness and prudence preferences are further analyzed both within an Expected Utility Theory framework as well as with Cumulative Prospect Theory For this a sound experimental setup is used that also excludes any potentially distortionary effects from loss aversion This dissertation therefore contributes to better understanding of individual risk preferences and other impact factors such as a more rational vs a more intuitive decision making process in individual decision making
