Spectroscopic Tricks

Kent Albert Meyer

Spectroscopic Tricks:

Spectroscopic Tricks Leopold May, 2012-12-06 Spectroscopic Tricks was introduced in 1959 as a special section in the journal Applied Spectroscopy. Its purpose was to provide a means for communicating information on new devices, modifications of existing apparatuses and other items of this nature of interest to the working spectroscopist. That it has proved valuable is indicated by the continuing publication of this section now under the title of Spectroscopic Techniques. However, the usefulness of these contributions scattered through the many issues of the journal diminishes as time passes since the reader must consult the annual indices of many volumes of the journal to find the contribution that may hold the solution to his problem. The collection of the contributions into a single volume for the years 1959 through 1965 made it easier for the reader to make this search. The success of the first volume has prompted the continuation of these collections. The contributions in this second volume are selected from the years 1966 through 1969. They are arranged in the same manner as in the previous volume according to the area of spectroscopy. Those concerned with the same devices are placed together so that the reader can compare them readily. To maintain the advantages inherent in a single collection of articles, the subject index for this volume includes all the entries and page references from the original volume. Both author and journal indices are also provided, the latter citing the original Applied Spectroscopy edition.

Spectroscopic and Diffraction Techniques in Interfacial Electrochemistry C. Gutiérrez, C.A. Melendres, 2012-12-06 Electrochemistry is one of the oldest branches of Physical Chemistry. Having its foundations in the work of Faraday, Arrhenius and others, it evolved from the study of transport in electrolyte solutions to that of electrode kinetics. Kinetic methods are inherently unable to identify unequivocally the species involved in a reaction. Therefore, beginning in the 70s, many spectroscopic and diffraction techniques were applied to the study of the electrode-electrolyte interface in order to identify intermediary reaction species and even the spatial arrangement of atoms or molecules at the interface. In order to disseminate these techniques, a NATO Advanced Study Institute was held at Puerto de la Cruz, Tenerife, Canary Islands, Spain, from July 2 to 15, 1988. The Institute consisted of tutorial-type lectures, poster sessions and round-table discussions. It was attended by over 65 participants from NATO member countries and others from Argentina and Japan. In the present volume, most of the lectures presented at the Institute have been collected. At least one chapter is devoted to each technique. Emphasis has been made on case studies rather than theory, which can be found in textbooks and other publications. Our purpose in this book is to help the electrochemists uninitiated in spectroscopic methods to decide which techniques would be suitable for application to their particular problems. We thank all the lecturers who contributed to this volume and even those UHPs (Unrepentant Habitual Procrastinators) who did not, in spite of our urgings to do so.
