*Speech Production and Speech Modelling* W.J. Hardcastle, Alain Marchal, 1990-06-30 Speech sound production is one of the most complex human activities it is also one of the least well understood This is perhaps not altogether surprising as many of the complex neurological and physiological processes involved in the generation and execution of a speech utterance remain relatively inaccessible to direct investigation and must be inferred from careful scrutiny of the output of the system from details of the movements of the speech organs themselves and the acoustic consequences of such movements Such investigation of the speech output have received considerable impetus during the last decade from major technological advancements in computer science and biological transducing making it possible now to obtain large quantities of quantitative data on many aspects of speech articulation and acoustics relatively easily Keeping pace with these advancements in laboratory techniques have been developments in theoretical modelling of the speech production process There are now a wide variety of different models available reflecting the different disciplines involved linguistics speech science and technology engineering and acoustics The time seems ripe to attempt a synthesis of these different models and theories and thus provide a common forum for discussion of the complex problem of speech production Such an activity would seem particularly timely also for those colleagues in speech technology seeking better more accurate phonetic models as components in their speech synthesis and automatic speech recognition systems

**Speech Production and Speech Modelling** W.J. Hardcastle, Alain Marchal, 2012-12-06 Speech sound production is one of the most complex human activities it is also one of the least well

understood This is perhaps not altogether surprising as many of the complex neurological and physiological processes involved in the generation and execution of a speech utterance remain relatively inaccessible to direct investigation and must be inferred from careful scrutiny of the output of the system from details of the movements of the speech organs themselves and the acoustic consequences of such movements Such investigation of the speech output have received considerable impetus during the last decade from major technological advancements in computer science and biological transducing making it possible now to obtain large quantities of quantitative data on many aspects of speech articulation and acoustics relatively easily Keeping pace with these advancements in laboratory techniques have been developments in theoretical modelling of the speech production process There are now a wide variety of different models available reflecting the different disciplines involved linguistics speech science and technology engineering and acoustics The time seems ripe to attempt a synthesis of these different models and theories and thus provide a common forum for discussion of the complex problem of speech production Such an activity would seem particularly timely also for those colleagues in speech technology seeking better more accurate phonetic models as components in their speech synthesis and automatic speech recognition systems

Models and Theories of Speech Production Adamantios Gafos,Pascal van Lieshout,2020-08-07      **Developments in Speech Synthesis** Mark Tatham,Katherine Morton,2005-10-31 With a growing need for understanding the process involved in producing and perceiving spoken language this timely publication answers these questions in an accessible reference Containing material resulting from many years teaching and research Speech Synthesis provides a complete account of the theory of speech By bringing together the common goals and methods of speech synthesis into a single resource the book will lead the way towards a comprehensive view of the process involved in human speech The book includes applications in speech technology and speech synthesis It is ideal for intermediate students of linguistics and phonetics who wish to proceed further as well as researchers and engineers in telecommunications working in speech technology and speech synthesis who need a comprehensive overview of the field and who wish to gain an understanding of the objectives and achievements of the study of speech production and perception      **Speech Production and Perception** Mark Tatham,Katherine Morton,2016-01-13 This book aims to develop a framework for a fully explanatory theory of speech production and speech perception It emphasises the difference between static models primarily descriptive and dynamic models that attempt to show how the basic linguistics and phonetics are related in an actual human speaker listener      Proceedings of the 5th Seminar on Speech Production ,2000      *Expression in Speech* Mark Tatham,Katherine Morton,2004 Human beings communicate expressively with each other in conversation now in the computer age there is a perceived need for machines to communicate expressively with humans in dialogue This title presents research examining expressive content in speech with a view to simulating expression in computer speech      *The Handbook of Speech Production* Melissa A. Redford,2019-02-12 The Handbook of Speech Production is the first reference work to provide an overview of this

burgeoning area of study Twenty four chapters written by an international team of authors examine issues in speech planning motor control the physical aspects of speech production and external factors that impact speech production Contributions bring together behavioral clinical computational developmental and neuropsychological perspectives on speech production to create a rich and truly interdisciplinary resource Offers a novel and timely contribution to the literature and showcases a broad spectrum of research in speech production methodological advances and modeling Coverage of planning motor control articulatory coordination the speech mechanism and the effect of language on production processes

*Dynamic Speech Models* Li Deng, 2006-12-01 Speech dynamics refer to the temporal characteristics in all stages of the human speech communication process This speech chain starts with the formation of a linguistic message in a speaker's brain and ends with the arrival of the message in a listener's brain Given the intricacy of the dynamic speech process and its fundamental importance in human communication this monograph is intended to provide a comprehensive material on mathematical models of speech dynamics and to address the following issues How do we make sense of the complex speech process in terms of its functional role of speech communication How do we quantify the special role of speech timing How do the dynamics relate to the variability of speech that has often been said to seriously hamper automatic speech recognition How do we put the dynamic process of speech into a quantitative form to enable detailed analyses And finally how can we incorporate the knowledge of speech dynamics into computerized speech analysis and recognition algorithms The answers to all these questions require building and applying computational models for the dynamic speech process What are the compelling reasons for carrying out dynamic speech modeling We provide the answer in two related aspects First scientific inquiry into the human speech code has been relentlessly pursued for several decades As an essential carrier of human intelligence and knowledge speech is the most natural form of human communication Embedded in the speech code are linguistic as well as para linguistic messages which are conveyed through four levels of the speech chain Underlying the robust encoding and transmission of the linguistic messages are the speech dynamics at all the four levels Mathematical modeling of speech dynamics provides an effective tool in the scientific methods of studying the speech chain Such scientific studies help understand why humans speak as they do and how humans exploit redundancy and variability by way of multitiered dynamic processes to enhance the efficiency and effectiveness of human speech communication Second advancement of human language technology especially that in automatic recognition of natural style human speech is also expected to benefit from comprehensive computational modeling of speech dynamics The limitations of current speech recognition technology are serious and are well known A commonly acknowledged and frequently discussed weakness of the statistical model underlying current speech recognition technology is the lack of adequate dynamic modeling schemes to provide correlation structure across the temporal speech observation sequence Unfortunately due to a variety of reasons the majority of current research activities in this area favor only incremental modifications and improvements to the existing

HMM based state of the art For example while the dynamic and correlation modeling is known to be an important topic most of the systems nevertheless employ only an ultra weak form of speech dynamics e g differential or delta parameters Strong form dynamic speech modeling which is the focus of this monograph may serve as an ultimate solution to this problem After the introduction chapter the main body of this monograph consists of four chapters They cover various aspects of theory algorithms and applications of dynamic speech models and provide a comprehensive survey of the research work in this area spanning over past 20 years This monograph is intended as advanced materials of speech and signal processing for graudate level teaching for professionals and engineering practioners as well as for seasoned researchers and engineers specialized in speech processing

**Dynamic Articulatory Model of Speech Production Using Computer Simulation** William L. Henke,1966 A dynamic articulatory model of speech production is described From a phonemic input the model generates a description of the configuration of the articulatory mechanism in the midsagittal plane Positions shapes velocities and other descriptive features of the modeled vocal mechanism are contained in the state of the model Operators act as agents for modifying the state by trying to manipulate aspects of the state toward abstract goals which are associated with phonemes Goals are only changed discretely in time and in this way the desired transformation from a discrete phonemic input to a continuous articulatory output is accomplished The operator state bifurcation of the model allows some of the natural constraints of the real vocal mechanism to be included similarly in the model The model exhibits coarticulation effects attributable to phonemes preceding the current phoneme since the state configurative position responds only slowly to the goal directed operators owing to physical and physiological limitations Coarticulation effects attributable to following or future phonemes result from a look ahead procedure that may invoke goals of future phonemes when such goals do not conflict with the goals of the current or more immediate phonemes Thus anticipatory coarticulation results from a mechanism at a higher level than the sluggish response which causes post coarticulation The repertoire of speech sound types in the present model includes only vowels and stops but it is felt that the general methodologies are applicable to all speech sounds

**An Articulatory Model of Speech Production** Thomas Augustin Giordano, 1971 Advances in Non-Linear Modeling for Speech Processing Raghunath S. Holambe, Mangesh S. Deshpande, 2012-02-21 Advances in Non Linear Modeling for Speech Processing includes advanced topics in non linear estimation and modeling techniques along with their applications to speaker recognition Non linear aeroacoustic modeling approach is used to estimate the important fine structure speech events which are not revealed by the short time Fourier transform STFT This aeroacoustic modeling approach provides the impetus for the high resolution Teager energy operator TEO This operator is characterized by a time resolution that can track rapid signal energy changes within a glottal cycle The cepstral features like linear prediction cepstral coefficients LPCC and mel frequency cepstral coefficients MFCC are computed from the magnitude spectrum of the speech frame and the phase spectra is neglected To overcome the problem of neglecting the phase spectra the speech production system can be represented as an amplitude modulation frequency modulation AM FM model To demodulate the speech signal to estimation the amplitude envelope and instantaneous frequency components the energy separation algorithm ESA and the Hilbert transform demodulation HTD algorithm are discussed Different features derived using above non linear modeling techniques are used to develop a speaker identification system Finally it is shown that the fusion of speech production and speech perception mechanisms can lead to a robust feature set
