Almquist, 1989 Neogene Deformation between Central Utah and the Mojave Desert R. Ernest Anderson, 2013-10-24 This book is a must read for researchers interested in extensional tectonics in general and the Neogene tectonics of the Basin and Range in particular because it challenges on the basis of more than 50 years of field studies the existing paradigm of province wide uniformly large extension and replaces it with a model integrating extension with extension normal shortening both as primary strains The first chapter takes the reader on two journeys southwestward from central Utah through the Lake Mead area the first to emphasize the lack of uniformly distributed or integrated extension and the second to highlight left lateral shear at 13 localities along the east margin of the Basin and Range that is kinematically compatible with right lateral shear along the west margin The compatibility provides a basis for understanding the extreme Neogene tectonics of the Lake Mead area The second chapter summarizes multifaceted field evidence from the well studied eastern Lake Mead area as a focused example of the need for a complete revision of the extensional paradigm Publisher s description **Geology of the Sheeprock Thrust Sheet, Central Utah - New Insights** Malay Mukul, Gautam Mitra, 1998 Proterozoic sedimentary rocks in the Sheeprock and the adjacent West Tintic Mountains in northcentral Utah were thought to be deformed and transported along the Sheeprock and Pole Canyon thrusts during the Cretaceous to early Tertiary Sevier Orogeny Evidence from the observed stratigraphy stratigraphic separation diagrams downplunge projections of the structure large scale relationships between bedding and cleavage orientations microstructural observations and finite strain data indicate that the Pole Canyon and the Sheeprock thrusts are the same fault the Sheeprock thrust The Sheeprock thrust was folded into a gentle synform and subsequently offset by motion along the Indian Springs fault Based on the offset pattern of the folded Sheeprock thrust along the Indian Springs fault and multiple slickenlines on the Indian Springs fault two components of motion are recognized a dextral strike slip component and a dip slip component of motion where the southern block is downthrown The relative age between the two components is not clear Assessment of Regional Earthquake Hazards and Risk Along the Wasatch Front, Utah Paula Gori, Walter W.
