

GEOMETRICAL OPTICS

- Branch of physics that studies nature and geometrical properties of light, how it interacts with matter and general design of instruments (optical) for its usage and detection.

Nature of light

The nature of light was for many years remained a great mystery even though we know that light is an electromagnetic wave.

By 18th century, the general acceptance as favoured by Isaac Newton was that light consisted of a stream of particles traveling in straight lines which produced a sensation of vision as they encroached on the retina (eye).

Lastly it was Maxwell who predicted electromagnetic waves that propagate at the speed of light ($c = 2.9979 \times 10^8 \text{ m/s} = 3 \times 10^8 \text{ m/s}$).

Finally, Hertz went on to demonstrate how the electromagnetic waves showed the same interference, reflection, refraction and polarization effects as light (does).

Today, scientists view the behavior of light as waves (electromagnetic waves) in some situations and particles (photons) in other situation, that is, light is recognized as having both wave and particle properties. This is known as **wave-particle duality**.

Huygens' Principle

- Huygens Christiaan (Dutch physicist) proposed a simple theory of light (1678). The theory assumes that light is a wave but nothing was given about the details of light waves. The complete and accurate theory of electromagnetic waves was elaborated by Maxwell (1878). Huygens gave an idea of how light waves should move and his statement (statement of the principle) was that **"All points of a wave front can be considered as sources of spherical wavelets which spread in all directions. After time t the new position of a wave**

Cooper, John B. Seamon, 1967 A Semiempirical technique utilizing the methods of geometrical optics is used to examine the effect of geologic layering on the surface peak particle velocity associated with the direct compressional wave produced by underground nuclear explosions This geometric technique is different from former ray techniques in that it accounts for the curvature of the wave front i e the divergence of the rays as well as the distance the wave travels Data from contained nuclear explosions in homogeneous media are used to determine the relationship between the peak particle velocity and the divergence of the rays This empirical relationship is then used for layered media where the divergence of the rays is determined by the methods of geometrical optics to predict the free surface peak particle velocity The required transmission and reflection factors are currently taken from the theory of elastic wave propagation Several parametric studies and comparisons with data from experiments in layered media are presented It is found that a number of previously unexplained departures from what was measured and what might intuitively be expected are qualitatively and sometimes quantitatively predicted by this technique It is emphasized that layering between the source and the free surface which usually occurs can have a profound and deceiving effect on the surface motion and therefore it should not be neglected in any prediction technique Author Publications of the Jet Propulsion Laboratory Jet Propulsion Laboratory (U.S.), 1969 **Toward a Scientific Practice of Science Education** Marjorie Gardner, James G.
