study of the vadose zone has been based on own continuous long term measurements and analyses of precipitation on the
surface and of several representative trickles in the vadose zone of Postojna Cave over consecutive hydrological years It
offers an explanation of the dynamics of the percolation of water and simultaneous transfer of contaminants and their impact
on the dissolution of carbonate rock in the vadose zone The research contributes to the understanding of the role of the
vadose zone in the karst aquifer The emphasis is placed on a multi parameter approach based on the simultaneous use of a
number of different methods not only tracing natural tracers such as the continuous measurement of discharge temperature
electrical conductivity isotopic composition of oxygen content of carbonates calcium magnesium chlorides nitrates sulfates
and o phosphates electrical resistivity imaging but also tests with artificial tracers using different methods of injection The
research contributes to the understanding of the role of the vadose zone in the karst aquifers and is directly applicable in
