The Physiology Of Insect Reproduction:

The Physiology of Insect Reproduction Franz Engelmann, 2013-10-22 The Physiology of Insect Reproduction provides a comprehensive coverage of insect reproductive system The title details basic phenomena governing reproductive processes in insects with the whole spectrum of an insect reproductive cycle The text first covers insect genitalia and proceeds to discussing sex determination Next the selection talks about the development of unfertilized eggs in insects The text also deals with gonadal development along with insect mating behavior Chapter 7 details the factors that affect egg production and fecundity while Chapter 8 tackles hormonal control of egg maturation The ninth chapter covers endocrine influence on reproduction in the male insect The next chapters discuss oviposition heterogony and viviparity The last two chapters deal with functional hermaphroditism and insect societies respectively The book will be of great use to students and researchers in the field of entomology

Insect Reproduction S. R. Leather, 2018-01-18 This book consisting of ten review chapters contributed by leading workers in their respective fields from around the world covers the whole subject of insect reproduction It begins with the basic physiological questions of insect reproduction moves on to discuss the new advances seen in the fields of behavioural and ecological mechanisms and culminates by examining the recent work on evolutionary biology and its application in the field Each chapter although including a brief review of the basic seminal work focuses mainly on the advances made within the last ten years and highlights those areas in which the respective authors see the greatest scope for further important advances

Insect Hormones H. Frederik Nijhout, 2021-02-09 Although insect endocrinology is one of the oldest and most active branches of insect physiology its classic general texts are long out of date while its abundant primary literature provides little biological context in which to make sense of the discipline as a whole In this book H Frederik Nijhout s goal is to provide a complete concise and up to date source for students and nonspecialists seeking an overview of the dynamic and wide ranging science that insect endocrinology has become since its beginnings nearly eighty years ago in the study of insect metamorphosis The author offers a comprehensive survey of the many roles that hormones play in the biology of insects Among the topics discussed are the control of molting metamorphosis reproduction caste determination in social insects diapause migration carbohydrate and lipid metabolism diuresis and behavior The account features a summary of the most current and accurate thinking on the complex roles of ecdysone and juvenile hormone in the control of metamorphosis a process still misunderstood and misrepresented in biological textbooks and many professional reviews Throughout the book s emphasis is on the biology of the organism and the ways in which physiological and developmental regulatory mechanisms are integrated into the insect s life cycle

Reproductive Strategies in Insects Omkar, Geetanjali Mishra, 2022-02-15 Reproduction is one of the most inherent tasks that all living organisms are actively involved in It forms the backbone of their existence with all evolutionary energies directed over billion years of creation into maximizing reproductive effort For so simple and directed a need such as maximizing reproduction it is

interesting to see how much diversity and complexity exists in this task Each organism despite having the same end goal employs different strategies The complexities intricacies and strategies of successful reproduction while being extremely fascinating are equally befuddling Reproductive Strategies in Insects provides an expansive critical look at the reproductive strategies of the most diverse group of animals the insects Insects which inhabit myriad niches in all ecosystems except the oceans show the most diverse reproductive strategies ranging from simplest to most complex Reproductive strategies viz search for mates number of mates display of mate quality assessment of mate quality acceptance of mate rejection of mates forced copulations the fight for paternity pre during and post copula the modulation of paternity ovipositional strategies and parental care are described in detail in this book Also each strategy is analyzed in relation to its morphological physiological ethological ecological and evolutionary aspects Features Covers a wide variety of reproductive strategies A detailed step by step description of reproductive strategies Discusses morphological physiological ethological ecological and evolutionary aspects Modulation of these strategies and responsible modulatory factors are also discussed Well illustrated Recent research results and probable future research directions This is a niche reference book for ethologists biologists studying behavioural evolution and entomologists It may also be used as a textbook for a graduate level course in behaviour Insect Reproduction Extremes Ritika Gupta, AI, 2025-03-04 Insect Reproduction Extremes unveils the astonishing diversity in insect reproductive strategies exploring how these creatures perpetuate their species through unusual mating behaviors and alternative reproductive modes From elaborate courtship rituals to aggressive competition insect mating behaviors reveal the diverse pressures shaping reproductive success A prime example of their extreme adaptations is parthenogenesis asexual reproduction seen in aphids which challenges traditional definitions of sex The book builds upon established entomological research while incorporating recent discoveries in genetics behavior and ecology It emphasizes that insect reproductive strategies are remarkably adaptable driven by evolutionary pressures to maximize success in various environments This comprehensive exploration highlights the importance of understanding the full spectrum of reproductive strategies when managing insect populations The book unfolds in a logical sequence starting with fundamental concepts and progressing to specific case studies of unusual mating behaviors and alternative reproductive modes like traumatic insemination It concludes with a discussion of the broader implications for conservation pest management and our understanding of evolutionary processes making it a valuable resource for anyone interested in entomology and evolutionary biology

Entomology Cedric Gillott, 2013-11-11 Extensively revised the Second Edition continues to offer senior undergraduate students a well balanced treatment of all major areas in entomology This edition features coverage of the new phylogenies for most of the insect orders The Evolution of Insect Mating Systems David Shuker, Leigh Simmons, 2014-07-31 Insects display a staggering diversity of mating and social behaviours Studying these systems provides insights into a wide range of evolutionary and behavioural questions such as the evolution of sex sexual selection sexual conflict and parental care This

edited volume provides an authoritative update of the landmark book in the field *The Evolution of Insect Mating Systems* Thornhill and Alcock 1983 which had such a huge impact in shaping adaptationist approaches to the study of animal behaviour and influencing the study of the evolution of reproductive behaviour far beyond the taxonomic remit of insects This accessible new volume brings the empirical and conceptual scope of the original book fully up to date incorporating the wealth of new knowledge and research of the last 30 years It explores the evolution of complex forms of sex determination in insects and the role of sexual selection in shaping the evolution of mating systems Selection arising via male contest competition and female choice both before and after copulation are discussed as are the roles of parasites and pathogens in mediating the strength of sexual selection and the role that parental care plays in successful reproduction *The Evolution of Insect Mating Systems* is suitable for both graduate students and researchers interested in insect mating systems or behaviour from an evolutionary genetical physiological or ecological perspective Due to its interdisciplinary and concept driven approach it will also be of relevance and use to a broad audience of evolutionary biologists

Chromatography and Isolation of Insect Hormones and Pheromones A.R. McCaffery, I.D. Wilson, 2012-12-06 The connection between the study of insects their development behaviour and biochemistry and chromatography is perhaps not immediately obvious However this connection exists and it is of fundamental importance to our understanding of many areas of insect physiology Insects range in size from small to minute and consequently the amounts of hormones or pheromones they produce are equally minute Ultimately any attempt at understanding the processes which control development social behaviour or the biochemistry of insects requires some means of isolating the tiny quantities of the hormones and pheromones responsible in sufficient quantity and purity for identification The ability to devise novel techniques to separate these materials from frequently complex biological mixtures including precursors and metabolites and to devise detection systems for them is vital Methods for the quantification of these substances at different stages in the life cycle or in response to environmental change or stress are then essential Chromatography both as a means for isolation and as a method for quantitative analysis has been an essential tool in these studies This volume represents the outcome of a joint international symposium organized by the Chromatographic and Royal Entomological Societies at the University of Reading between the 21st and 23rd March 1989 aimed specifically at discussing the chromatography and isolation of insect hormones pheromones and related substances The papers presented at that meeting and collected together here covered many aspects of the subject including the chromatography of juvenile hormones ecdysteroids peptides pheromones and semio chemicals

Insect Neurohormones Marie Raabe, 2012-12-06 The discovery of insect neurohormones dates from the earliest experimental investigations in insect endocrines and the matter cannot be discussed without evoking the names of its pioneers Kopec Wigglesworth Fraenkel Whereas the experiments demonstrated the existence of the first known neurohormones the formulation of the concept of neurosecretion was of fundamental importance to further progress and tribute must be paid to Ernst and Berta Scharrer The

recent proliferation of investigations into insect neurohormones has created the need for an overall review of the data. Our knowledge of the subject is voluminous and the evidence clearly demonstrates that neurohormones play a part in most insect regulatory processes. This book analyzes and synthesizes the data starting from neurosecretion i.e. source sites and release modes of neurohormones and continuing through the various functions in which neurohormones have been shown to be involved: endocrine gland activity, diapause, reproduction, visceral muscle functioning, color change, behavior, water and ion balance, protein, sugar and lipid metabolism and tanning and other processes occurring at the cuticle level. In each chapter, besides the experimental information, technical procedures as well as recent information concerning purification of the particular neurohormones and their mode of action are reported. Numerous exhaustive tables allow the reader to get an overview of the matter while the major findings of the moment are presented in the conclusion of each chapter.

Insect Biology in The Future Michael Locke, 2012-12-02. Insect Biology in the Future V.B.W. 80 contains essays presented to Sir Vincent Wigglesworth during his 80th year. Wigglesworth is fairly designated as the founding father and remarkable leader of insect physiology. His papers and other works significantly contribute to this field of study. This book dedicated to him underlines the value of insect material in approaching a wide spectrum of biological issues. The essays in this book tackle the insects' physiology including their evolution and dominance. The papers also discuss the various avenues of water loss and gain as interrelated components of overall water balance in land arthropods. This reference suggests possible areas for further research mainly at the whole animal level. It also describes the fat body, hemolymph, endocrine control of vitellogenin synthesis, reproduction, growth hormones, chemistry, defense and survival of insects. Other topics of importance include cell communication and pattern formation in insects, plant-insect interaction and insecticides.
