Studies In Number Theory Vol 6:

On Some of the Smarandache Problems, Vol. II Mladen V. Vassilev-Missana, Krassimir T. Atanasov, 2005 Five years after having published the first volume the authors obtained many new results related to Smarandache Problems They are collected in this book and deal with Smarandache sequences infinite numbers functions formulas conjectures in Number Theory

Fundamentals of Number Theory William J. LeVeque, 2014-01-05 This excellent textbook introduces the basics of number theory incorporating the language of abstract algebra A knowledge of such algebraic concepts as group ring field and domain is not assumed however all terms are defined and examples are given making the book self contained in this respect The author begins with an introductory chapter on number theory and its early history Subsequent chapters deal with unique factorization and the GCD quadratic residues number theoretic functions and the distribution of primes sums of squares quadratic equations and quadratic fields diophantine approximation and more Included are discussions of topics not always found in introductory texts factorization and primality of large integers p adic numbers algebraic number fields Brun's theorem on twin primes and the transcendence of e to mention a few Readers will find a substantial number of well chosen problems along with many notes and bibliographical references selected for readability and relevance Five helpful appendixes containing such study aids as a factor table computer plotted graphs a table of indices the Greek alphabet and a list of symbols and a bibliography round out this well written text which is directed toward undergraduate majors and beginning graduate students in mathematics No post calculus prerequisite is assumed 1977 edition

Non-commutative and Non-associative Algebra and Analysis Structures Sergei Silvestrov, Anatoliy Malyarenko, 2023-09-25 The goal of the 2019 conference on Stochastic Processes and Algebraic Structures held in SPAS2019 Västerås Sweden from September 30th to October 2nd 2019 was to showcase the frontiers of research in several important topics of mathematics mathematical statistics and its applications The conference has been organized along the following tracks 1 Stochastic processes and modern statistical methods in theory and practice 2 Engineering Mathematics 3 Algebraic Structures and applications This book highlights the latest advances in algebraic structures and applications focused on mathematical notions methods structures concepts problems algorithms and computational methods for the natural sciences engineering and modern technology In particular the book features mathematical methods and models from non commutative and non associative algebras and rings associated to generalizations of differential calculus quantum deformations of algebras Lie algebras Lie superalgebras color Lie algebras Hom algebras and their n ary generalizations semi groups and group algebras non commutative and non associative algebras and computational algebra interplay with q special functions and q analysis topology dynamical systems representation theory operator theory and functional analysis applications of algebraic structures in coding theory information analysis geometry and probability theory The book gathers selected high quality contributed chapters from several large research communities working on modern algebraic structures and their applications

The chapters cover both theory and applications and are illustrated with a wealth of ideas theorems notions proofs examples open problems and results on the interplay of algebraic structures with other parts of Mathematics The applications help readers grasp the material and encourage them to develop new mathematical methods and concepts in their future research Presenting new methods and results reviews of cutting edge research open problems and directions for future research will serve as a source of inspiration for a broad range of researchers and students

Arithmetic and Geometry over Local Fields Bruno Anglès, Tuan Ngo Dac, 2021-03-03 This volume introduces some recent developments in Arithmetic Geometry over local fields Its seven chapters are centered around two common themes the study of Drinfeld modules and non Archimedean analytic geometry The notes grew out of lectures held during the research program Arithmetic and geometry of local and global fields which took place at the Vietnam Institute of Advanced Study in Mathematics VIASM from June to August 2018 The authors leading experts in the field have put great effort into making the text as self contained as possible introducing the basic tools of the subject The numerous concrete examples and suggested research problems will enable graduate students and young researchers to quickly reach the frontiers of this fascinating branch of mathematics

Development Projects in Science Education, 1977 **The Classical Groups and K-Theory** Alexander J. Hahn, O. Timothy O'Meara, 2013-03-09 It is a great satisfaction for a mathematician to witness the growth and expansion of a theory in which he has taken some part during its early years When H Weyl coined the words classical groups foremost in his mind were their connections with invariant theory which his famous book helped to revive Although his approach in that book was deliberately algebraic his interest in these groups directly derived from his pioneering study of the special case in which the scalars are real or complex numbers where for the first time he injected Topology into Lie theory But ever since the definition of Lie groups the analogy between simple classical groups over finite fields and simple classical groups over $\mathbb{R}$ or $\mathbb{C}$ had been observed even if the concept of simplicity was not quite the same in both cases With the discovery of the exceptional simple complex Lie algebras by Killing and E Cartan it was natural to look for corresponding groups over finite fields and already around 1900 this was done by Dickson for the exceptional Lie algebras G and E However a deep reason for this 2 6 parallelism was missing and it is only Chevalley who in 1955 and 1961 discovered that to each complex simple Lie algebra corresponds by a uniform process a group scheme f_j over the ring $\mathbb{Z}$ of integers from which for any field K could be derived a group $f_j K$ **The Undecidable** Martin Davis, 2004-01-01 A valuable collection both for original source material as well as historical formulations of current problems The Review of Metaphysics Much more than a mere collection of papers A valuable addition to the literature Mathematics of Computation An anthology of fundamental papers on undecidability and unsolvability by major figures in the field this classic reference is ideally suited as a text for graduate and undergraduate courses in logic philosophy and foundations of mathematics It is also appropriate for self study The text opens with Godel's landmark 1931 paper demonstrating that systems of logic cannot admit proofs of all true assertions of arithmetic Subsequent

papers by Godel Church Turing and Post single out the class of recursive functions as computable by finite algorithms Additional papers by Church Turing and Post cover unsolvable problems from the theory of abstract computing machines mathematical logic and algebra and material by Kleene and Post includes initiation of the classification theory of unsolvable problems Supplementary items include corrections emendations and added commentaries by Godel Church and Kleene for this volume s original publication along with a helpful commentary by the editor *Mathematical Logic in the 20th Century* Gerald E. Sacks, 2003 This invaluable book is a collection of 31 important both in ideas and results papers published by mathematical logicians in the 20th Century The papers have been selected by Professor Gerald E Sacks Some of the authors are Gdel Kleene Tarski A Robinson Kreisel Cohen Morley Shelah Hrushovski and Woodin

Quantization, Geometry and Noncommutative Structures in Mathematics and Physics Alexander Cardona, Pedro Morales, Hernán Ocampo, Sylvie Paycha, Andrés F. Reyes Lega, 2017-10-26 This monograph presents various ongoing approaches to the vast topic of quantization which is the process of forming a quantum mechanical system starting from a classical one and discusses their numerous fruitful interactions with mathematics The opening chapter introduces the various forms of quantization and their interactions with each other and with mathematics A first approach to quantization called deformation quantization consists of viewing the Planck constant as a small parameter This approach provides a deformation of the structure of the algebra of classical observables rather than a radical change in the nature of the observables When symmetries come into play deformation quantization needs to be merged with group actions which is presented in chapter 2 by Simone Gutt The noncommutativity arising from quantization is the main concern of noncommutative geometry Allowing for the presence of symmetries requires working with principal fiber bundles in a non commutative setup where Hopf algebras appear naturally This is the topic of chapter 3 by Christian Kassel Nichols algebras a special type of Hopf algebras are the subject of chapter 4 by Nicol s Andruskiewitsch The purely algebraic approaches given in the previous chapters do not take the geometry of space time into account For this purpose a special treatment using a more geometric point of view is required An approach to field quantization on curved space time with applications to cosmology is presented in chapter 5 in an account of the lectures of Abhay Ashtekar that brings a complementary point of view to non commutativity An alternative quantization procedure is known under the name of string theory In chapter 6 its supersymmetric version is presented Superstrings have drawn the attention of many mathematicians due to its various fruitful interactions with algebraic geometry some of which are described here The remaining chapters discuss further topics as the Batalin Vilkovisky formalism and direct products of spectral triples This volume addresses both physicists and mathematicians and serves as an introduction to ongoing research in very active areas of mathematics and physics at the border line between geometry topology algebra and quantum field theory
