Slow Potential Changes In The Brain Brain Dynamics S:

Slow Potential Changes in the Brain Haschke, Speckmann, 2012-11-28 DC potential changes comprising fast fluctuations and slow shifts represent objective concomitants of neuronal processes in the brain. They can be recorded not only in animals but also in humans under various conditions. As far as slow brain potentials are concerned, exciting results have been detected with respect to their correlation to psychophysiological events. Although a large amount of data has been accumulated by psychophysiological, neurophysiological, and other scientists, the neurophysiological basis of these field potentials is still not clear and remains controversial. Scientists from European countries participated in an interdisciplinary symposium in the summer of 1990, July 2 to 6, at the Friedrich Schiller University in Jena, which covered the field of slow brain potentials from the psychophysiological to the cellular level, including glial cells and microenvironment. From this conference, the idea derived to present an up-to-date overview on important aspects of the field. The introductory remarks are given to elucidate what is thought to be a generator of slow potentials of the brain. The large number of sources, implications of the inverse problem to analyze field potentials, are taken into account. Oscillatory Event-Related Brain Dynamics Christo Pantev, Thomas Elbert, Bernd Lütkenhöner, 2013-11-21 How does the brain code and process incoming information? How does it recognize a certain object? How does a certain Gestalt come into our awareness? One of the key issues to conscious realization of an object of a Gestalt is the attention devoted to the corresponding sensory input, which evokes the neural pattern underlying the Gestalt. This requires that the attention be devoted to one set of objects at a time. However, the attention may be switched quickly between different objects or ongoing input processes. It is to be expected that such mechanisms are reflected in the neural dynamics. Neurons or neuronal assemblies which pertain to one object may fire possibly in rapid bursts at a time. Such firing bursts may enhance the synaptic strength in the corresponding cell assembly and thereby form the substrate of short-term memory. However, we may well become aware of two different objects at a time. How can we avoid that the firing patterns which may relate to say a certain type of movement, columns in V5, or to a color, V4, of one object do not become mixed with those of another object? Such a blend may only happen if the presentation times become very short, below 20-30 ms. One possibility is that neurons pertaining to one cell assembly fire synchronously. Then different cell assemblies firing at different rates may code different information. Brain Dynamics Erol Başar, Theodore H. Bullock, 2012-12-06 This volume is based on contributions to the second Brain Dynamics Conference held in Berlin on August 10-14, 1987, as a satellite conference of the Budapest Congress of the International Brain Research Organization. Like the volume resulting from the first conference, Dynamics of Sensory and Cognitive Processing by the Brain, the present work covers new approaches to brain function with emphasis on electromagnetic fields, EEG event-related potentials, connectivistic views, and neural networks. Close attention is also paid to research in the emerging field of deterministic chaos and strange attractors. The diversity of this collection of papers reflects a multipronged advance in a

hitherto relatively neglected domain i.e the study of signs of dynamic processes in organized neural tissue in order both to explain them and to exploit them for clues to system function The need is greater than ever for new windows This volume reflects a historical moment the moment when a relatively neglected field of basic research into available signs of dynamic processes ongoing in organized neural tissue is expanding almost explosively to complement other approaches From the topics treated this book should appeal as did its predecessor to neuroscientists neurologists scientists studying complex systems artificial intelligence and neural networks psychobiologists and all basic and clinical investigators concerned with new techniques of monitoring and analyzing the brain's electromagnetic activity

Dynamics of Sensory and Cognitive Processing by the Brain Theodore Melnechuk, Erol Başar, 2012-12-06 In neurophysiology the emphasis has been on single unit studies for a quarter century since the sensory work by Lettwin and coworkers and by Hubel and Wiesel the central work by Mountcastle the motor work by the late Evarts and so on In recent years however field potentials and a more global approach generally have been receiving renewed and increasing attention This is a result of new findings made possible by technical and conceptual advances and by the confirmation and augmentation of earlier findings that were widely ignored for being controversial or inexplicable To survey the state of this active field a conference was held in West Berlin in August 1985 that attempted to cover all of the new approaches to the study of brain function The approaches and emphases were very varied basic and applied electric and magnetic EEG and EP ERP connectionistic and field global and local fields surface and multielectrode low frequencies and high frequencies linear and non linear The conference comprised sessions of invited lectures a panel session of seven speakers on How brains may work and a concluding survey of relevant methodologies The conference showed that the combination of concepts methods and results could open up new important vistas in brain research Included here are the proceedings of the conference updated and revised by the authors Several attendees who did not present papers at the conference later accepted my invitation to write chapters for the book

sense of agency offers intriguing avenues for knowledge transfer across disciplines and interdisciplinary empirical approaches especially in addressing the afore mentioned outstanding questions The aim of the present research topic is to promote and facilitate such interdisciplinarity for a better understanding of why and how we typically experience our own actions so naturally and undoubtedly as ours and what goes awry when we do not We thus welcome contributions from for example i neuroscience and psychology including development psychology neuroscience ii psychiatry and neurology iii philosophy iv robotics and v computational modeling In addition to empirical or scientific studies of the sense of agency we also encourage theoretical contributions including reviews models and opinions
