Systems Carla Schlatter Ellis, 2022-05-31 This lecture provides an introduction to the problem of managing the energy demand of mobile devices Reducing energy consumption primarily with the goal of extending the lifetime of battery powered devices has emerged as a fundamental challenge in mobile computing and wireless communication The focus of this lecture is on a systems approach where software techniques exploit state of the art architectural features rather than relying only upon advances in lower power circuitry or the slow improvements in battery technology to solve the problem Fortunately there are many opportunities to innovate on managing energy demand at the higher levels of a mobile system Increasingly device components offer low power modes that enable software to directly affect the energy consumption of the system The challenge is to design resource management policies to effectively use these capabilities The lecture begins by providing the necessary foundations including basic energy terminology and widely accepted metrics system models of how power is consumed by a device and measurement methods and tools available for experimental evaluation For components that offer low power modes management policies are considered that address the questions of when to power down to a lower power state and when to power back up to a higher power state These policies rely on detecting periods when the device is idle as well as techniques for modifying the access patterns of a workload to increase opportunities for power state transitions For processors with frequency and voltage scaling capabilities dynamic scheduling policies are developed that determine points during execution when those settings can be changed without harming quality of service constraints The interactions and tradeoffs among the power management policies of multiple devices are discussed We explore how the effective power management on one component of a system may have either a positive or negative impact on overall energy consumption or on the design of policies for another component The important role that application level involvement may play in energy management is described with several examples of cross layer cooperation Application program interfaces APIs that provide information flow across the application OS boundary are valuable tools in encouraging development of energy aware applications Finally we summarize the key lessons of this lecture and discuss future directions in managing energy demand

B C, Before Computers: On Information Technology from Writing to the Age of Digital Data Stephen Robertson, 2020-10-22 I found it a delight to read The author is not trying to write yet another book on the history of computer developments but rather to show that those developments rely on a long history of humans creating solutions to problems that arose as they became more and more sophisticated in their treatment of concepts of information and its manipulation In many ways it resembles a work of philosophy more than a technical history but relies on explaining that technical history to make his points Michael R Williams Department of Computer Sciences University of Calgary The idea that the digital age has revolutionized our day to day experience of the world is nothing new and has been amply recognized by cultural historians In contrast Stephen Robertson's *BC Before Computers* is a work which questions the idea that the mid twentieth century saw a single moment of rupture It is about all the things that we had to learn invent and understand all the ways we had to evolve our thinking before we could enter the information technology revolution of the second half of the twentieth century Its focus ranges from the beginnings of data processing right back to such originary forms of human technology as the development of writing systems gathering a whole history of revolutionary moments in the development of information technologies into a single although not linear narrative Treading the line between philosophy and technical history Robertson draws on his extensive technical knowledge to produce a text which is both thought provoking and accessible to a wide range of readers The book is wide in scope exploring the development of technologies in such diverse areas as cryptography visual art and music and the postal system Through all this it does not simply aim to tell the story of computer developments but to show that those developments rely on a long history of humans creating technologies for increasingly sophisticated methods of manipulating information Through a clear structure and engaging style it brings together a wealth of informative and conceptual explorations into the history of human technologies and avoids assumptions about any prior knowledge on the part of the reader As such the expert and the general reader alike will find it of interest
