Rachid Guerraoui,Paolo Romano,2014-12-29 The advent of multi core architectures and cloud computing has brought parallel programming into the mainstream of software development Unfortunately writing scalable parallel programs using traditional lock based synchronization primitives is well known to be a hard time consuming and error prone task mastered by only a minority of specialized programmers Building on the familiar abstraction of atomic transactions Transactional Memory TM promises to free programmers from the complexity of conventional synchronization schemes simplifying the development and verification of concurrent programs enhancing code reliability and boosting productivity Over the last decade TM has been subject to intense research on a broad range of aspects including hardware and operating systems support language integration as well as algorithms and theoretical foundations On the industrial side

the major players of the software and hardware markets have been up front in the research and development of prototypical products providing support for TM systems This has recently led to the introduction of hardware TM implementations on mainstream commercial microprocessors and to the integration of TM support for the world's leading open source compiler In such a vast interdisciplinary domain the Euro TM COST Action IC1001 has served as a catalyzer and a bridge for the various research communities looking at disparate yet subtly interconnected aspects of TM This book emerged from the idea having Euro TM experts compile recent results in the TM area in a single and consistent volume Contributions have been carefully selected and revised to provide a broad coverage of several fundamental issues associated with the design and implementation of TM systems including their theoretical underpinnings and algorithmic foundations programming language integration and verification tools hardware supports distributed TM systems self tuning mechanisms as well as lessons learnt from building complex TM based applications

Mining and Control of Network Traffic by Computational Intelligence Federico Montesino Pouzols, Diego R. Lopez, Joaquim Barros, 2011-02-10 As other complex systems in social and natural sciences as well as in engineering the Internet is hard to understand from a technical point of view Packet switched networks defy analytical modeling The Internet is an outstanding and challenging case because of its fast development unparalleled heterogeneity and the inherent lack of measurement and monitoring mechanisms in its core conception This monograph deals with applications of computational intelligence methods with an emphasis on fuzzy techniques to a number of current issues in measurement analysis and control of traffic in the Internet First the core building blocks of Internet Science and other related networking aspects are introduced Then data mining and control problems are addressed In the first class two issues are considered predictive modeling of traffic load as well as summarization of traffic flow measurements The second class control includes active queue management schemes for Internet routers as well as window based end to end rate and congestion control The practical hardware implementation of some of the fuzzy inference systems proposed here is also addressed While some theoretical developments are described we favor extensive evaluation of models using real world data by simulation and experiments

Hardware for Soft Computing and Soft Computing for Hardware Nadia Nedjah, Luiza de Macedo Mourelle, 2013-11-18

Single and Multi Objective Evolutionary Computation MOEA Genetic Algorithms GAs Artificial Neural Networks ANNs Fuzzy Controllers FCs Particle Swarm Optimization PSO and Ant colony Optimization ACO are becoming omnipresent in almost every intelligent system design. Unfortunately, the application of the majority of these techniques is complex and so requires a huge computational effort to yield useful and practical results. Therefore, dedicated hardware for evolutionary, neural, and fuzzy computation is a key issue for designers. With the spread of reconfigurable hardware such as FPGAs, digital as well as analog hardware implementations of such computation become cost effective. The idea behind this book is to offer a variety of hardware designs for soft computing techniques that can be embedded in any final product. Also, to introduce the successful application of soft computing technique to solve many hard problems encountered during the design of embedded hardware designs. Reconfigurable embedded designs for GAs, ANNs, FCs, and PSO are presented and evaluated. Also, the application of quantum based evolutionary computation and multi objective evolutionary computation as well as ACO are applied to solve hard problems related to circuit synthesis, IP assignment, mapping, and routing of applications on Network On Chip infrastructures.
