Therefore, this book aims to explain the concept and characteristics of drylands, desert and desertification, land degradation, wastelands and the concept of ecosystem services. It also discusses various types of processes of land degradations, their characteristics, physics and indicators, along with mapping, monitoring and assessment of methods involved. Concept of Ocean Biological Deserts is discussed along with international and regional efforts towards combating land degradation and desertification. **Key Features** Provides all the aspects of desertification and land degradation at one place. Includes comprehensive methods to monitor different desertification and land degradation processes. Comprehensive overview of the mapping, monitoring and modelling techniques. Role of space-borne data in identifying, monitoring and combating desertification is evaluated and reported with real case studies. This book examines how Israel's engineers and scientists deal with the development and management of its limited water resources. Comprised of 13 chapters, this book starts with an overview of the interrelationships between man's well-being and the water environment. This text then explores the goal of water quality control in protecting human health and well-being from exposure to toxic chemicals and detrimental pathogenic microorganisms. Other chapters discuss the development of science, technology and administrative practice dealing with water quality control, including hygiene, environmental health, sanitation, sanitary engineering, ecology and environmental protection. The final chapter deals with the concept of hierarchical and selective water use. Biologists, engineers, chemists, agronomists, public health officers and water resources authorities will find this book extremely useful. *Advances in Soil Science*, 2012-12-06 The world population in 1930 was 2 billion. It reached 3 billion in 1960, stands at 4.6 billion today and is expected to reach 6 billion by the end of the century. The food and fiber needs of such a rapidly increasing population are

enormous One of the most basic resources perhaps the most basic of all for meeting these needs is the soil There is an urgent need to improve and protect this resource on which the future of mankind directly depends We must not only learn how to use the soil to furnish our immediate needs but also ensure that the ability of the soil to sustain food production in the future is unimpaired This is indeed a mammoth task a 1977 United Nations survey reported that almost one fifth of the world s cropland is now being steadily degraded This volume is the first of a new series entitled *Advances in Soil Science* The diversity of soil makes it necessary for research to be conducted in many locations There are basic principles however that are universal This new series will present clear and concise reviews in all areas of soil science for everyone interested in this basic resource and man s influence on it The purpose of the series is to provide a forum for leading scientists to analyze and summarize the available scientific information on a subject assessing its importance and identifying additional research needs
