The fields of X Ray Spectroscopy in Atomic and Solid State Physics have undergone spectacular growth sometimes rather anarchic during the past decade The old mold of X ray spectroscopy has been burst and this ASI provided an in depth exploration of theory and recently developed techniques however some work still needs to be done to create a new frame and reduce anarchy in the field The purpose of this Institute was to gather atomic and solid state physicists working in theoretical and new experimental techniques recently developed The lectures were concerned with among others the following fields theory of X ray near edge structure XPS and AES with conventional and synchrotron radiation sources PIXE EXAFS SEXAFS XRF SXS and molecular spectroscopy The Institute considered in detail some of these experimental tech niques and the pertinent theoretical interpretations by selecting an important list of lectures which summarize the scientific contents of the ASI The truly international character of this NATO ASI its size and the high quality of the lecturers contributed to make this school a very fruitful scientific meeting Two to four general lectures were given each working day and three afternoons were reserved for presentation of current work in the form of posters We think that these poster presentations reflect the current research work of the participants **Vibrational Spectroscopy of Solids** P. M. A. Sherwood, 1972-09-21 This 1972

monograph is devoted to the analysis and interpretation of the infrared and Raman spectra of solid compounds frequently used for their identification and characterization It was thought unsatisfactory to analyse such spectra by the theory applicable to gas phase samples though this was frequently done Furthermore the results obtained by far infrared and laser Raman spectrometers which detect the movement of atoms and or molecules as a whole had no gas phase analogy A separate approach to solid state vibrational spectra was therefore proposed within this volume Dr Sherwood describes the solid state physics of vibrational spectroscopy and extends it to the more complex structures of low symmetry He assumes an understanding of the infrared and Raman spectra of gases **Solid State NMR Spectroscopy for Biopolymers** Hazime

Saitô, Isao Ando, Akira Naito, 2006-08-05 Biopolymers are polymeric materials of biological origin including globular membrane and fibrous proteins polypeptides nucleic acids po saccharides lipids etc and their assembly although preference to respe ive subjects may be different among readers who are more interested in their biological significance or industrial and or medical applications Nevert less characterizing or revealing their secondary structure and dynamics may be an equally very important and useful issue for both kinds of readers Special interest in revealing the 3D structure of globular proteins nucleic acids and peptides was aroused in relation to the currently active Structural Biology X ray crystallography and multidimensional solution NMR sp troscopy have proved to be the standard and indispensable means for this purpose There remain however several limitations to this end if one intends to expand its scope further This is because these approaches are not always straightforward to characterize fibrous or membrane proteins owing to extreme difficulty in

crystallization in the former and insufficient spectral resolution due to sparing solubility or increased effective molecular mass in the presence of surrounding lipid bilayers in the latter
